Overview

- Images
- Image Filtering
- Morphological Operations
- Image Processing in Python

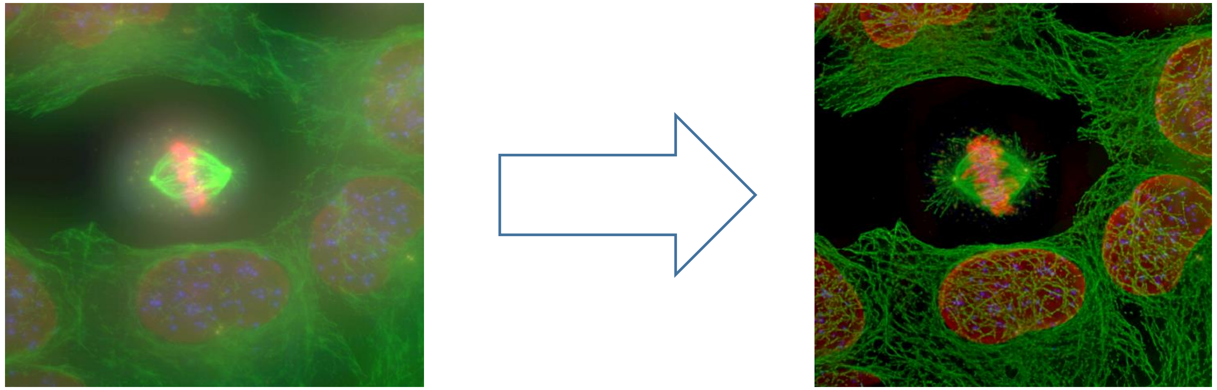

Image source: Alex Bird / Dan White MPI CBG

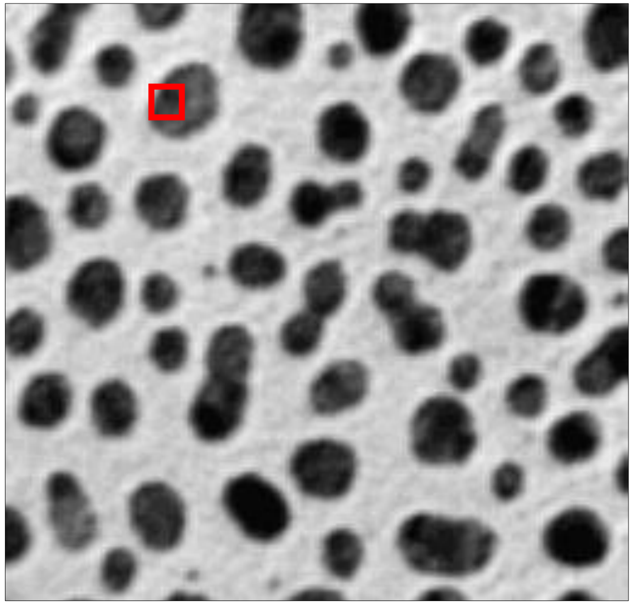
Images and pixels

- An image is just a matrix of numbers
- Pixel: “picture element”
- The edges between pixels are an artefact of the imaging / digitization. They are not real!



48	48	48	40	40	32	32	24	24	24	24	24	24	24

48	64	104	144	176	208	200	184	184	184	184	176	176	168

Colormaps / lookup tables

- The lookup table decides how the image is displayed on screen.
- Applying a different lookup table does not change the image. All pixel values stay the same, they just appear differently

Pixel value	Display color
0	1	
2	
...	
255	

Pixel value	Display color
0	1	
2	
...	
255	

Pixel value	Display color
0	1	
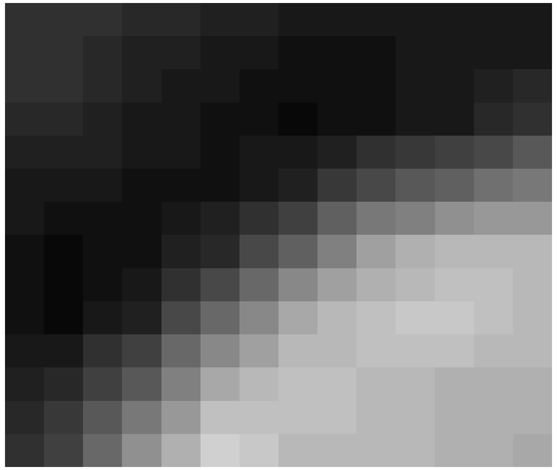
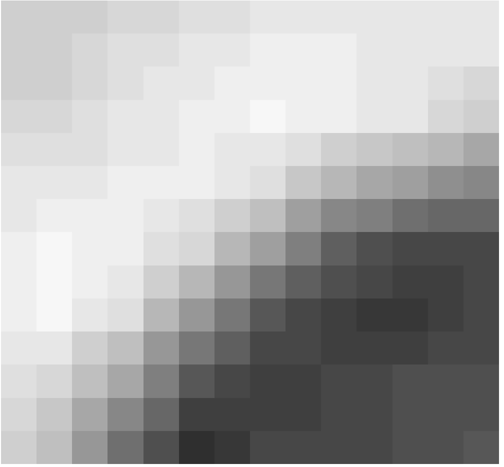
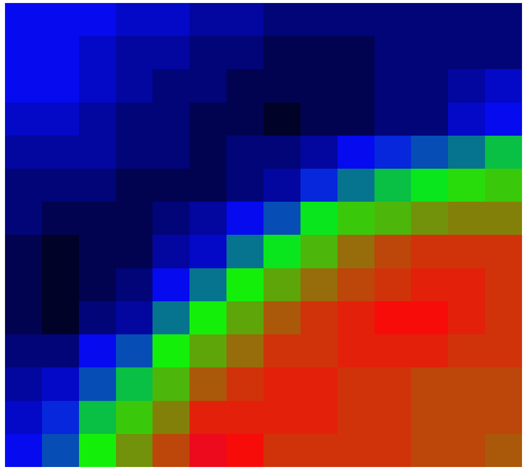
2	
...	
255	

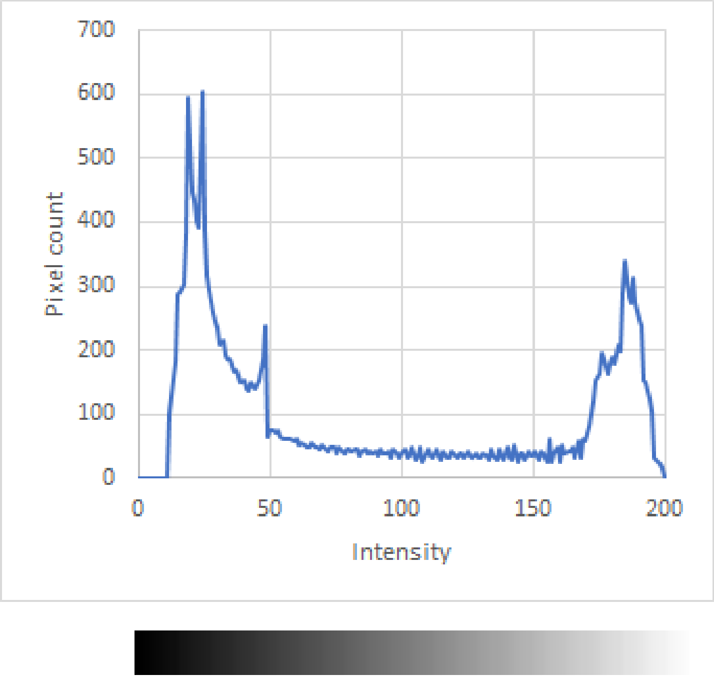


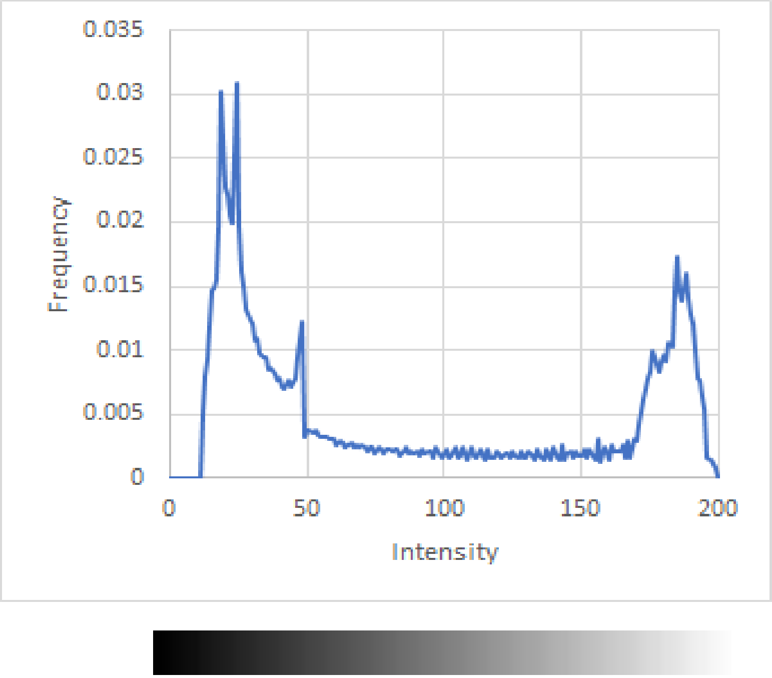




Histograms

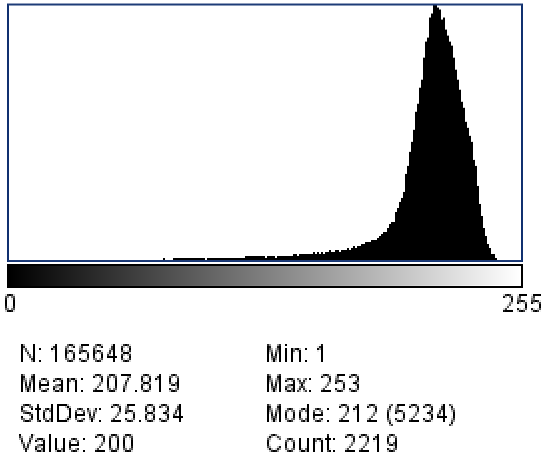
- A histogram shows the probability distribution of pixel intensities.
- The probability of a pixel having a certain grey value can be measured by counting pixels and calculating the frequency of the given intensity.
- Whenever you see a histogram, try to imagine the lookup-table on the X-axis

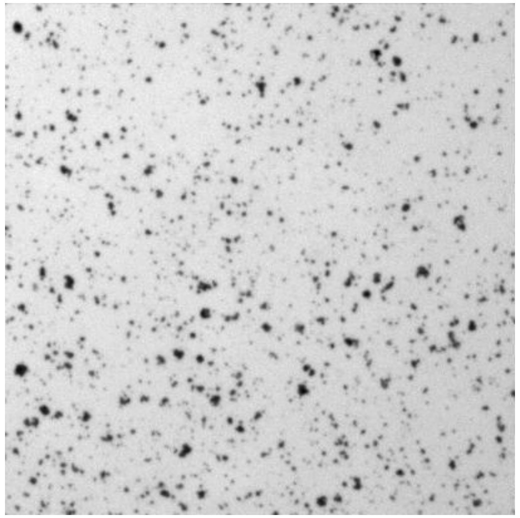


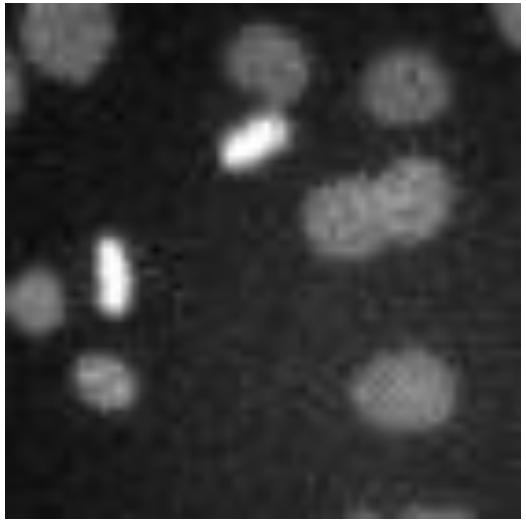


Histograms

- To which of the three images does this histogram belong to?

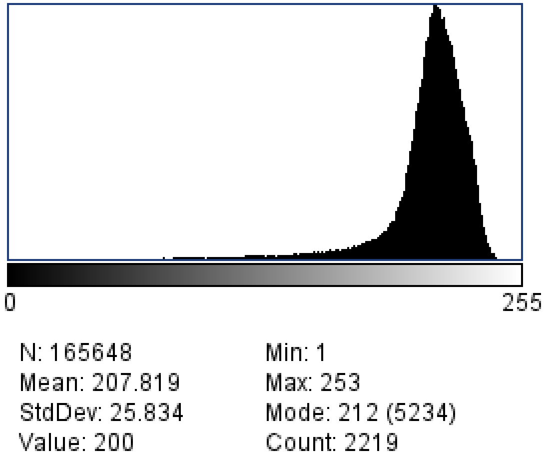


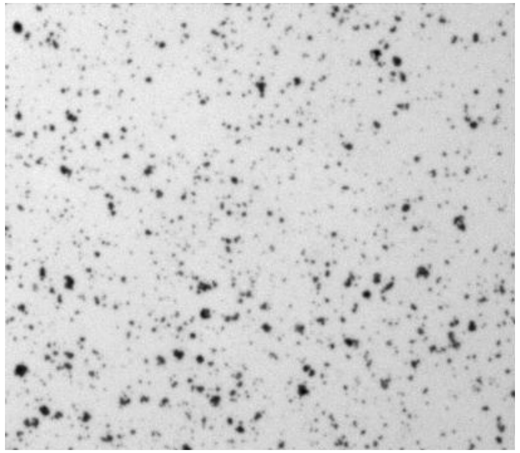


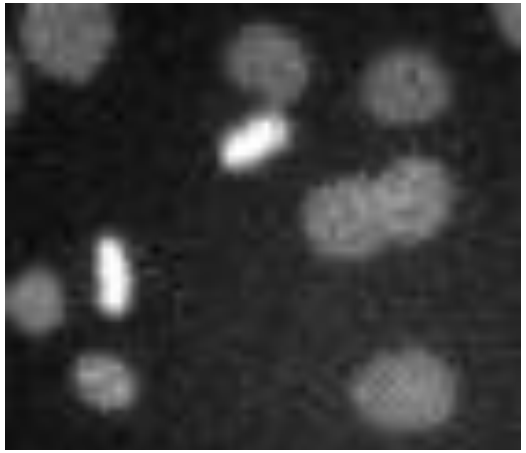


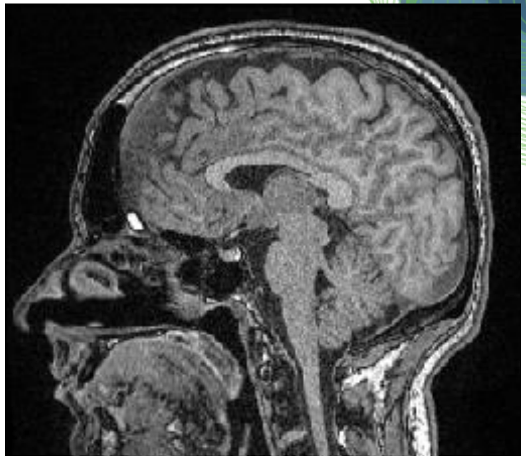
Histograms

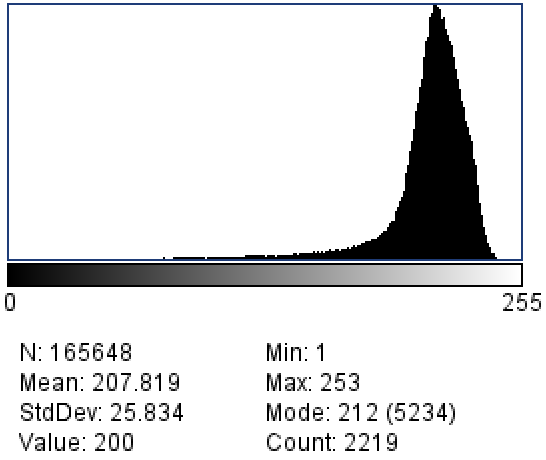
- To which of the three images does this histogram belong to?

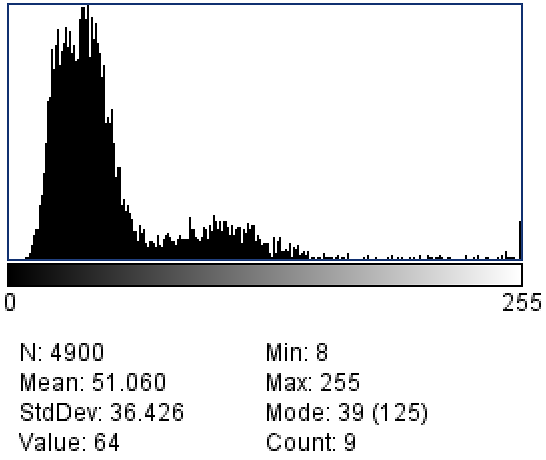












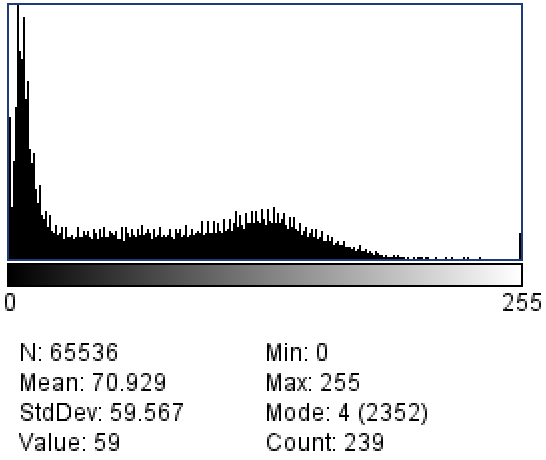


Image Filtering

With material from

Robert Haase,

Marcelo Leomil Zoccoler and Till Korten, PoL, TU Dresden

Filters

- An image processing filter is an operation on an image.
- It takes an image and produces a new image out of it.
- Filters change pixel values.

- There is no “best” filter. Which filter fits your needs, depends on the context.
- Filters do not do magic. They can not make things visible which are not in the image.

- Application examples
  - Noise-reduction
  - Artefact-removal
  - Contrast enhancement
  - Correct uneven illumination

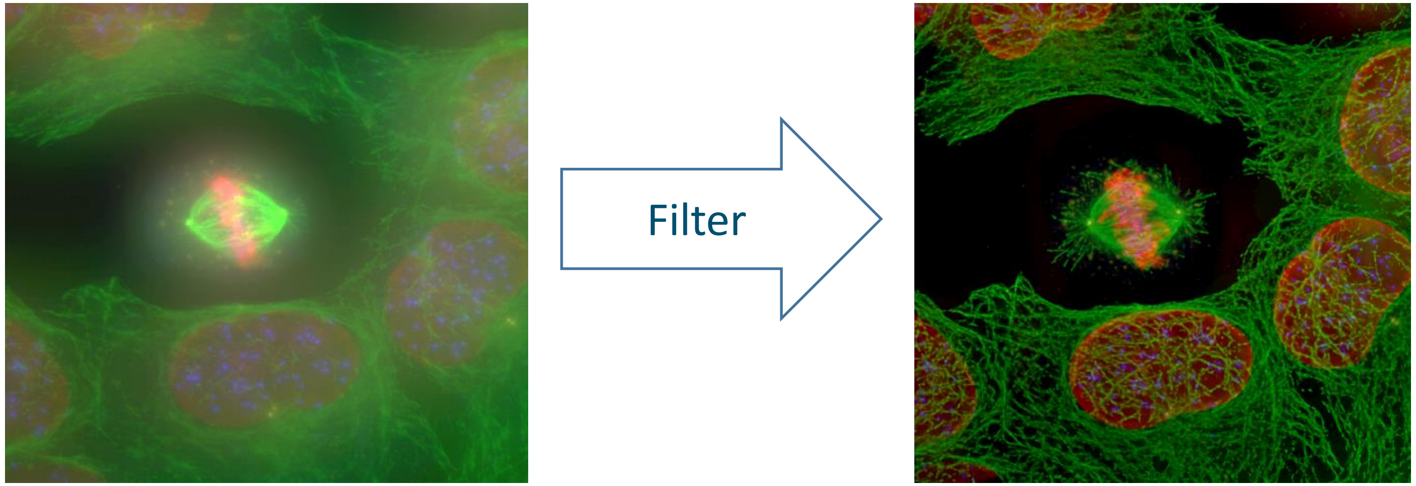

Image source: Alex Bird / Dan White MPI CBG

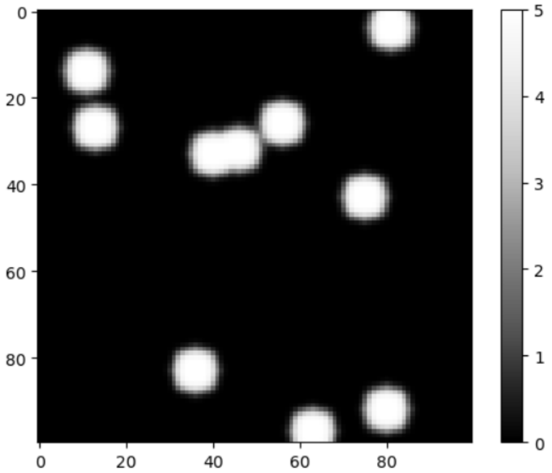
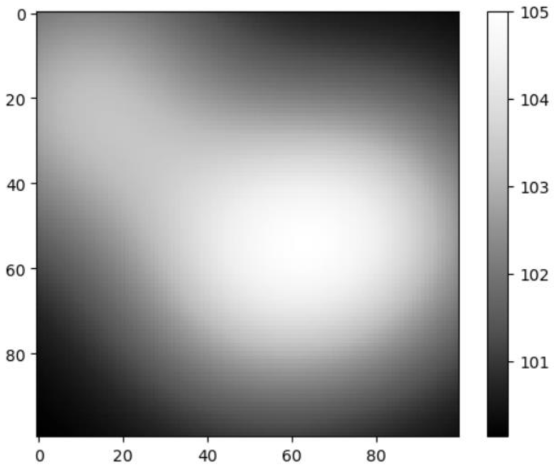
Effects harming image quality

- Image formation (simulated)

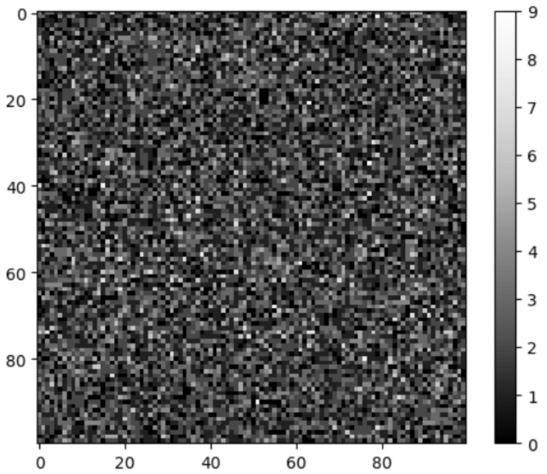
"nuclei"



"background"



"noise"



- Aberrations, defocus
- Motion blur

- Light from objects behind and in front of the scene (out-of-focus light)
- Dirt on the object slide
- Camera offset

- Shot noise (arriving photons)
- Dark noise (electrons made from photons)
- Read-out-noise (electronics)

https://github.com/BiAPoL/Bio-image_Analysis_with_Python/blob/49a787514a367829c3e0e1832f6cc533e96d549f/03_image_processing/simulated_dataset.ipynb

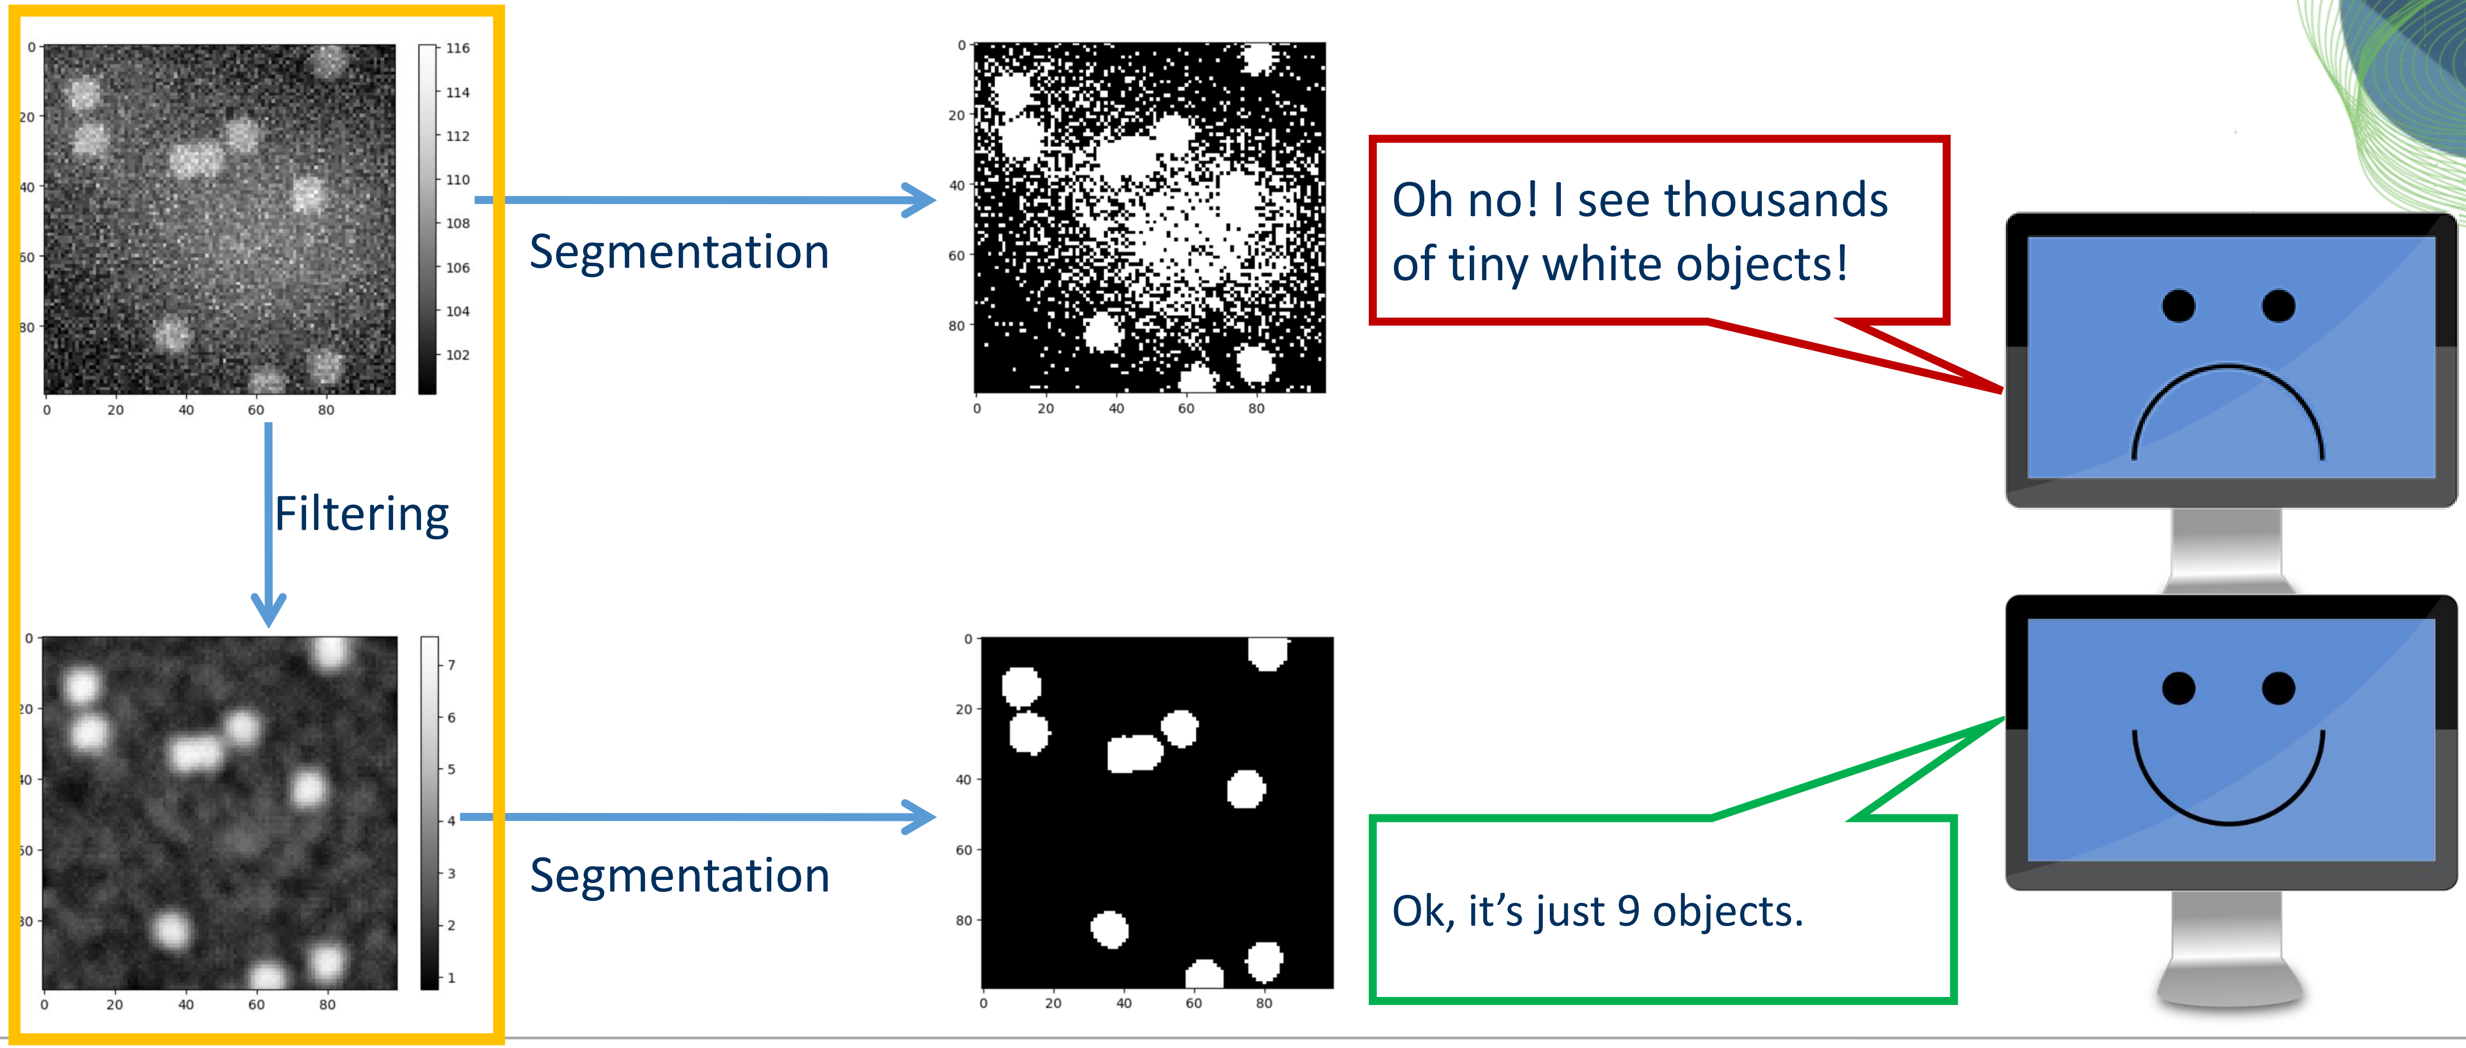
https://github.com/BiAPoL/Bio-image_Analysis_with_Python/blob/49a787514a367829c3e0e1832f6cc533e96d549f/03_image_processing/simulated_dataset.ipynb

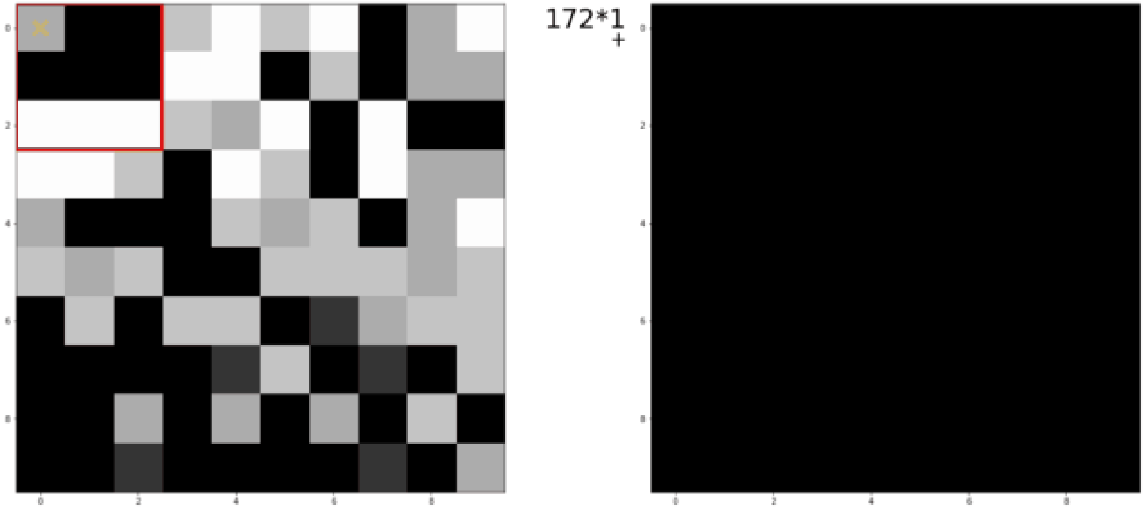
Image filtering

- We need to remove the noise to help the computer *interpreting* the image



Linear Filters

- *Linear filters* replace each pixel value with a weighted linear combination of surrounding pixels
- Filter *kernels* are matrices describing a linear filter
- This multiplication of surrounding pixels according to a matrix is called *convolution*



Animation source: Dominic Waithe, Oxford University
https://github.com/dwaithe/generalMacros/tree/master/convolution_ani

Mean filter, 3x3 kernel

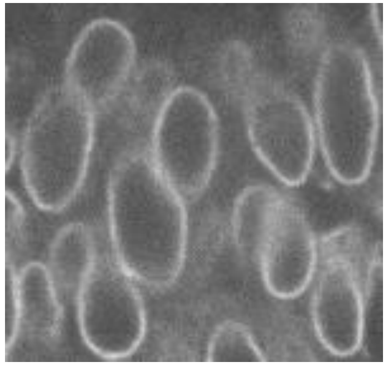
$\frac{1}{9}$	$\frac{1}{9}$	$\frac{1}{9}$
$\frac{1}{9}$	$\frac{1}{9}$	$\frac{1}{9}$
$\frac{1}{9}$	$\frac{1}{9}$	$\frac{1}{9}$

Linear filters

- Terminology:
  - “We convolve an image with a kernel.”
  - Convolution operator: *

Examples

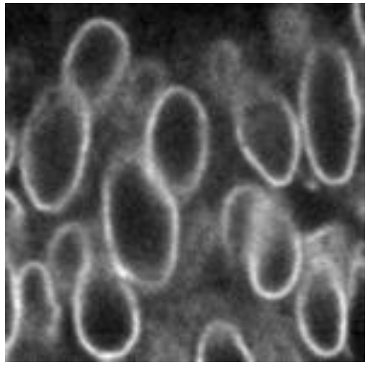
– Mean
– Gaussian blur
– Sobel-operator
– Laplace-filter

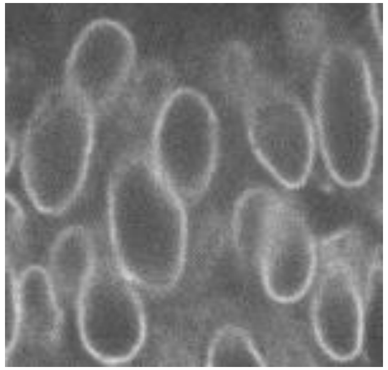


*

1	1	1
1	8	1
1	1	1

=

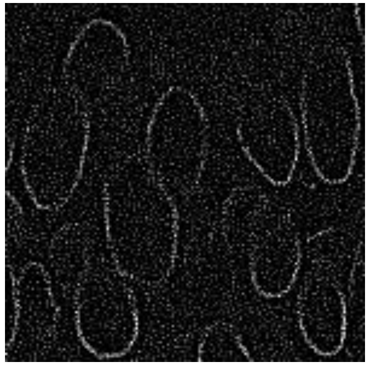




*

0	-1	0
-1	4	-1
0	-1	0

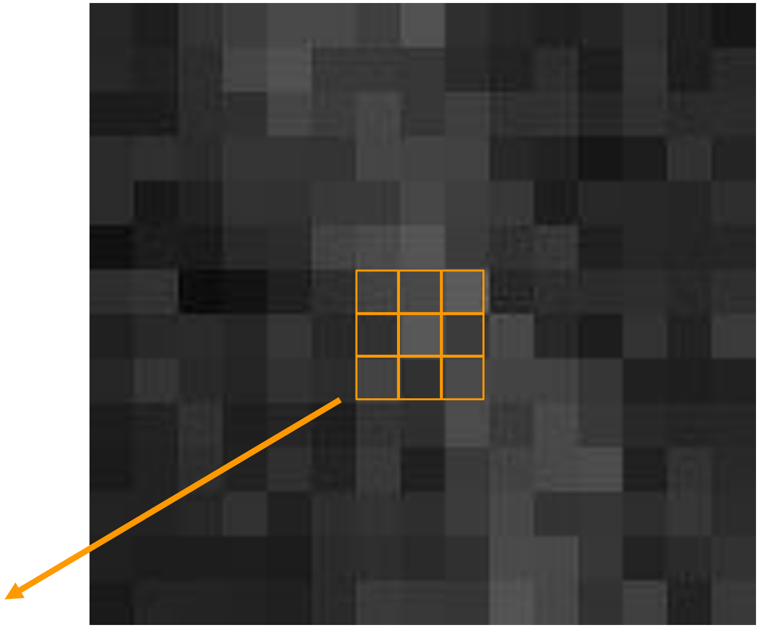
=



Nonlinear Filters

- Non linear filters also replace pixel value inside as rolling window but using a non-linear function.

- Examples: order statistics filters
  - Min
  - Median
  - Max
  - Variance
  - Standard deviation



75	85	60
67	73	91
50	88	59

[50 59 60 67 73 75 85 88 91]

Min Median Max

Noise removal

- Gaussian filter
- Median filter (computationally expensive)

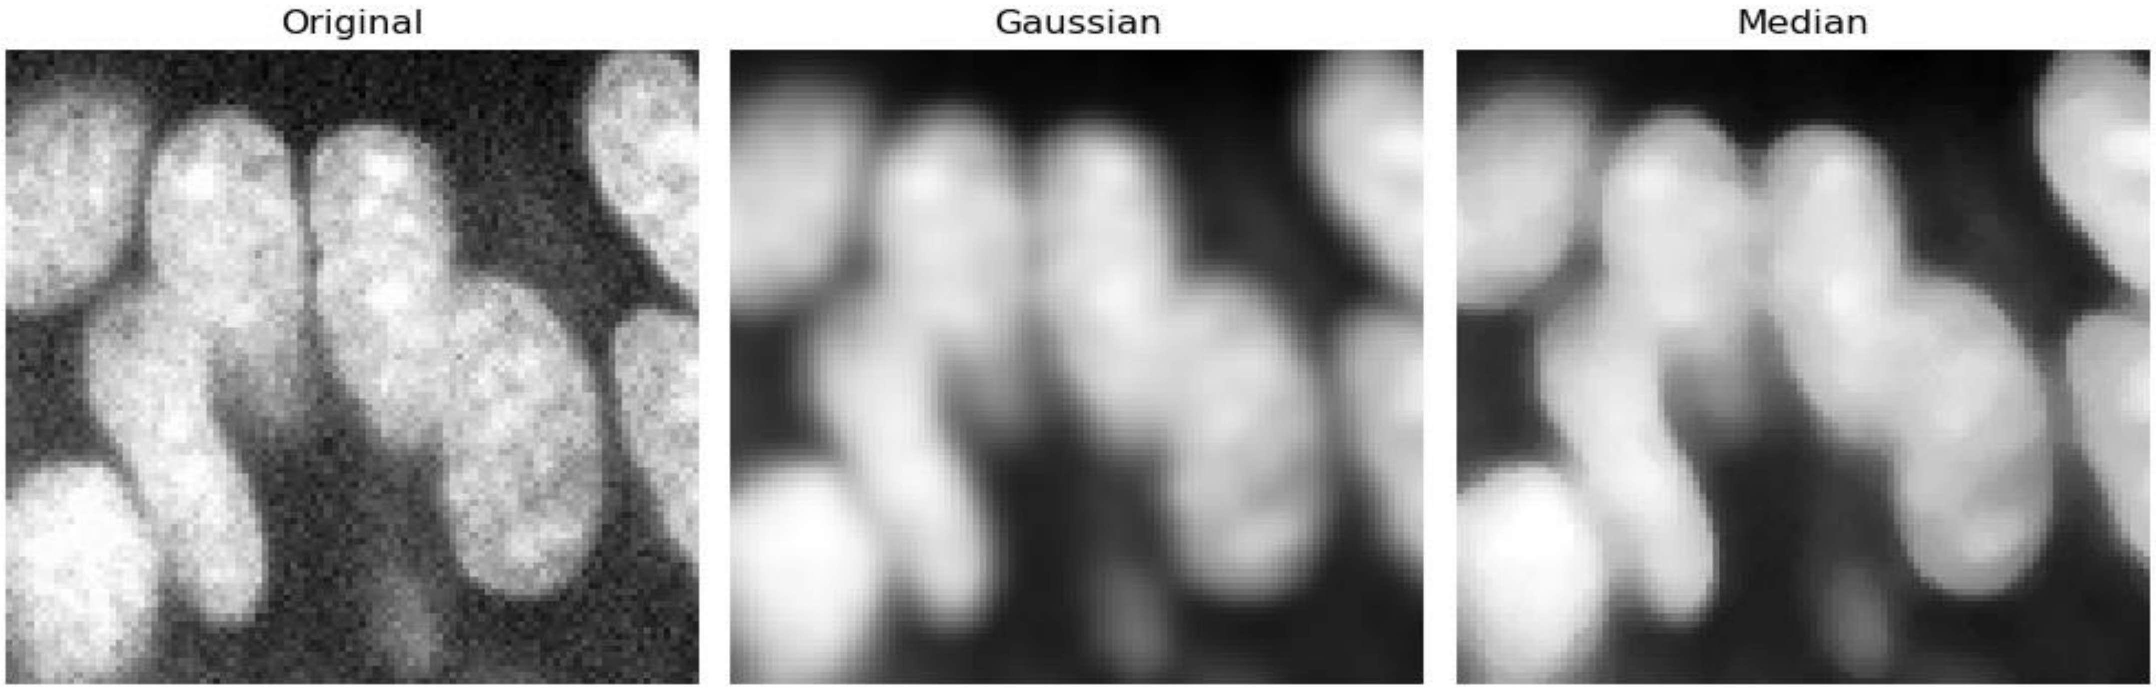


Image source: Mauricio Rocha Martins (Norden/Myers lab, MPI CBG)

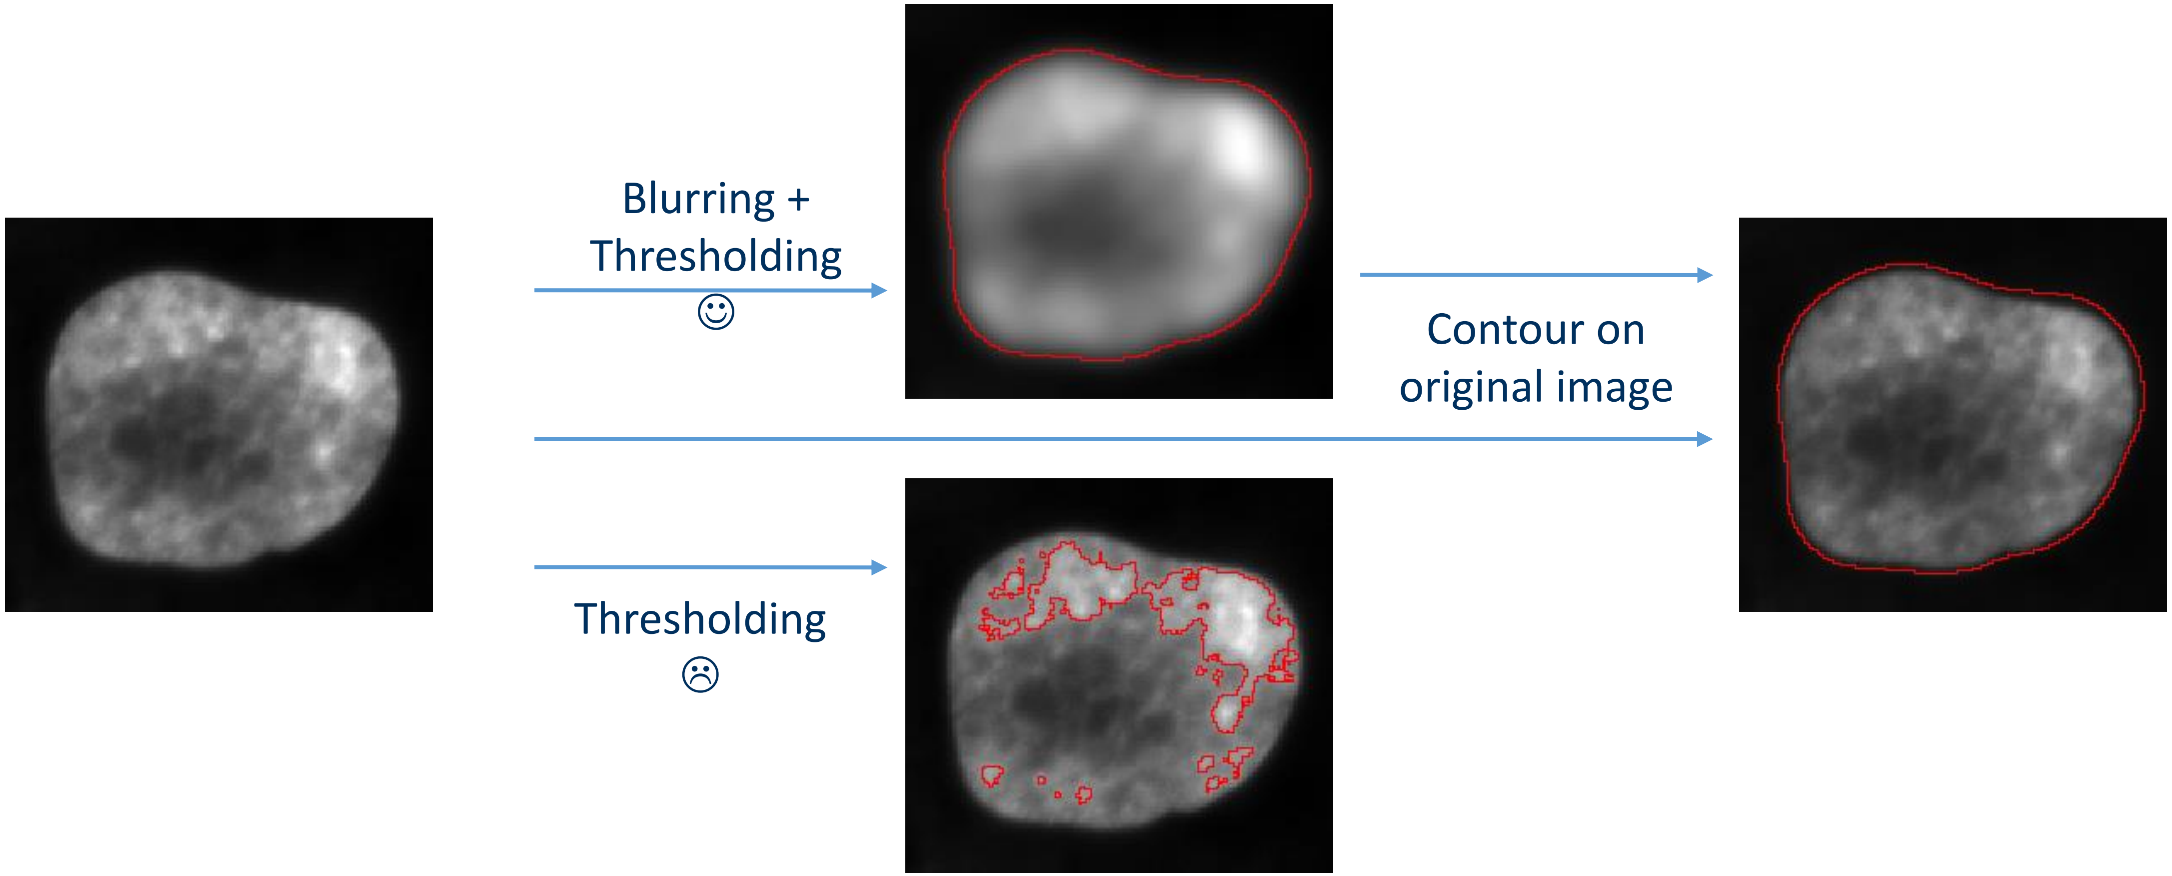
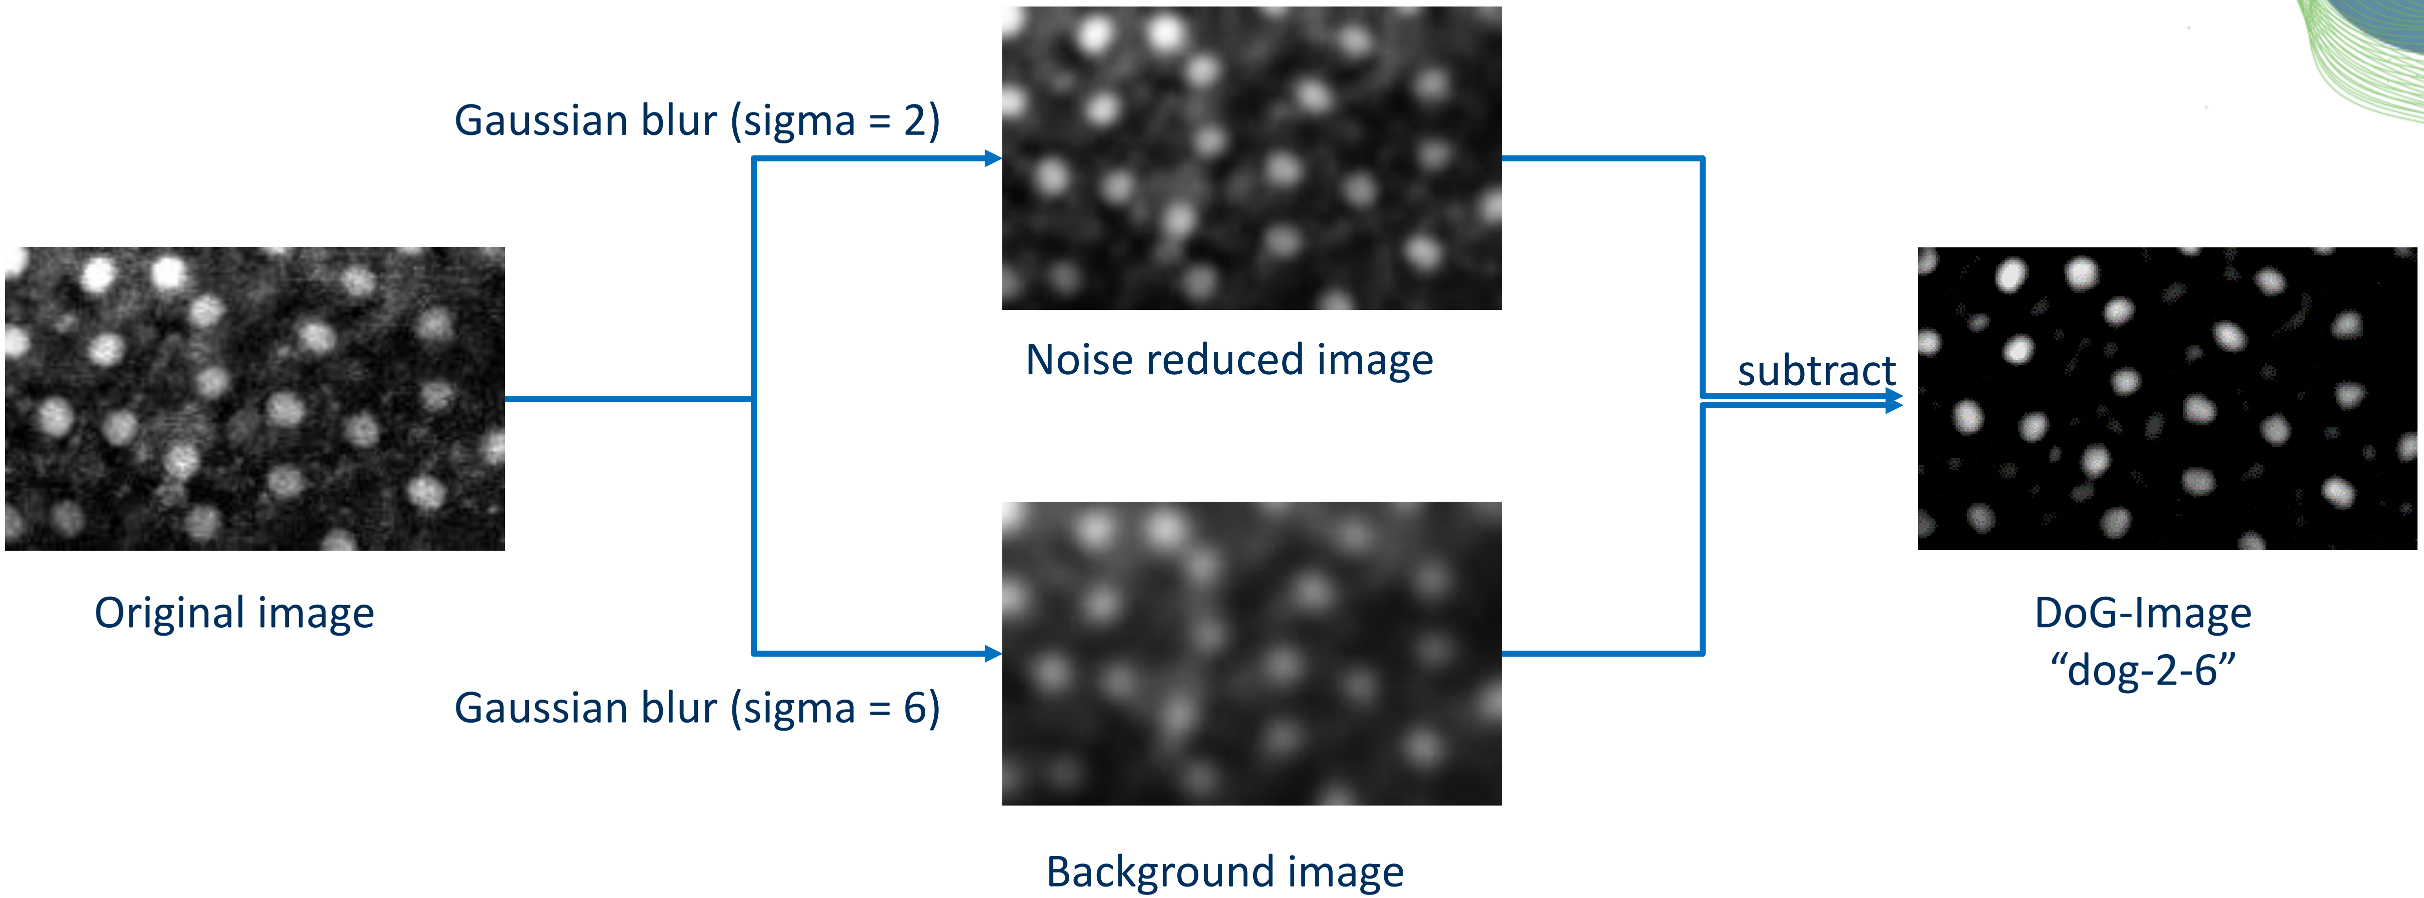
Filtering for improving thresholding results

- In case thresholding algorithms outline the wrong structure, <u>blurring in advance</u> may help.
- However: **Do not** continue processing the blurred image, continue with the original!



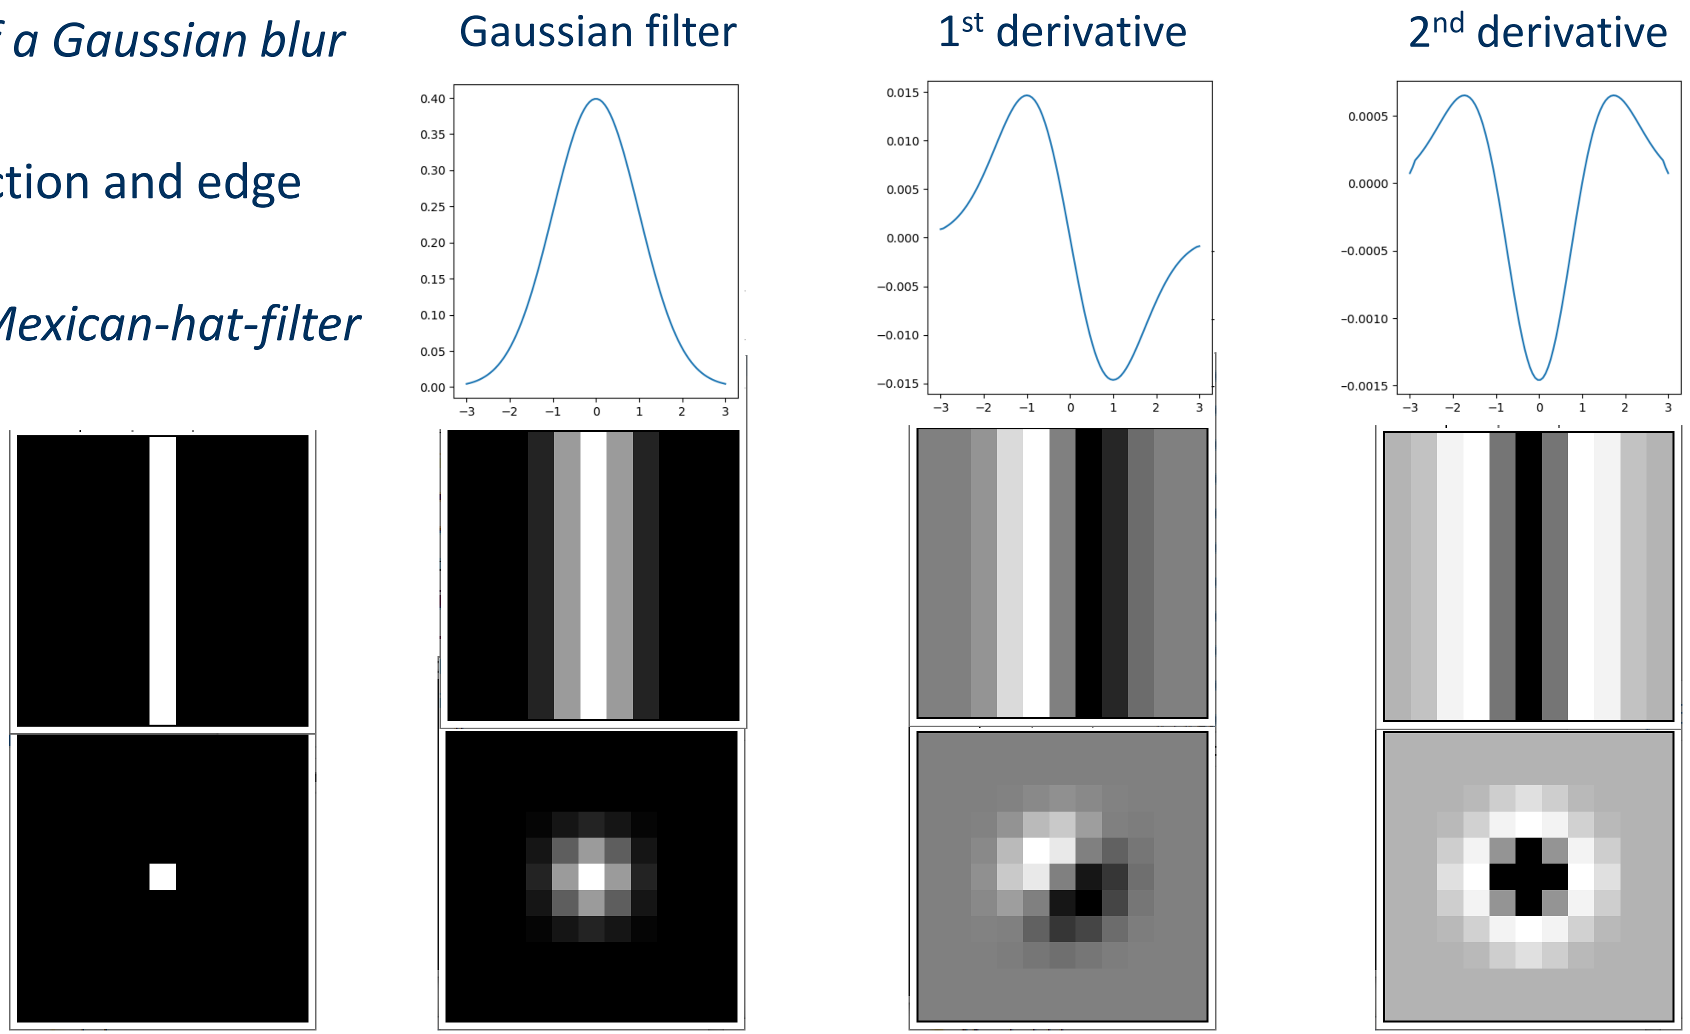
Difference-of-Gaussian (DoG)

- Improve image in order to detect bright objects.



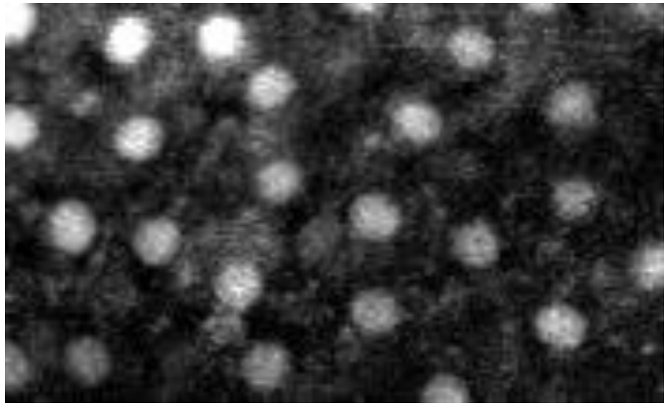
Laplace-filter

- *Second derivative of a Gaussian blur filter*
- Used for edge-detection and edge enhancement
- Also known as the *Mexican-hat-filter*



Laplacian-of-Gaussian (LoG)

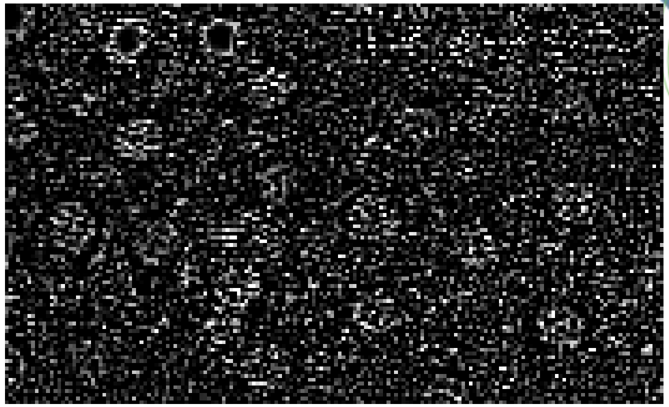
Laplace filter



*

0	-1	0
-1	4	-1
0	-1	0

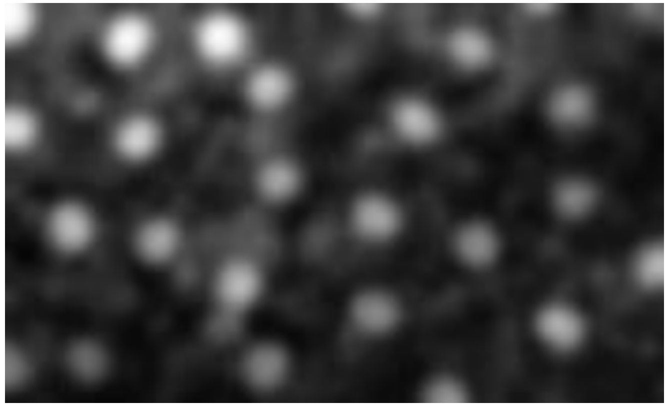
=



Laplace filtered image

Gaussian filter

Laplacian of Gaussian filter



*

0	-1	0
-1	4	-1
0	-1	0

Image Processing: Morphological Operations

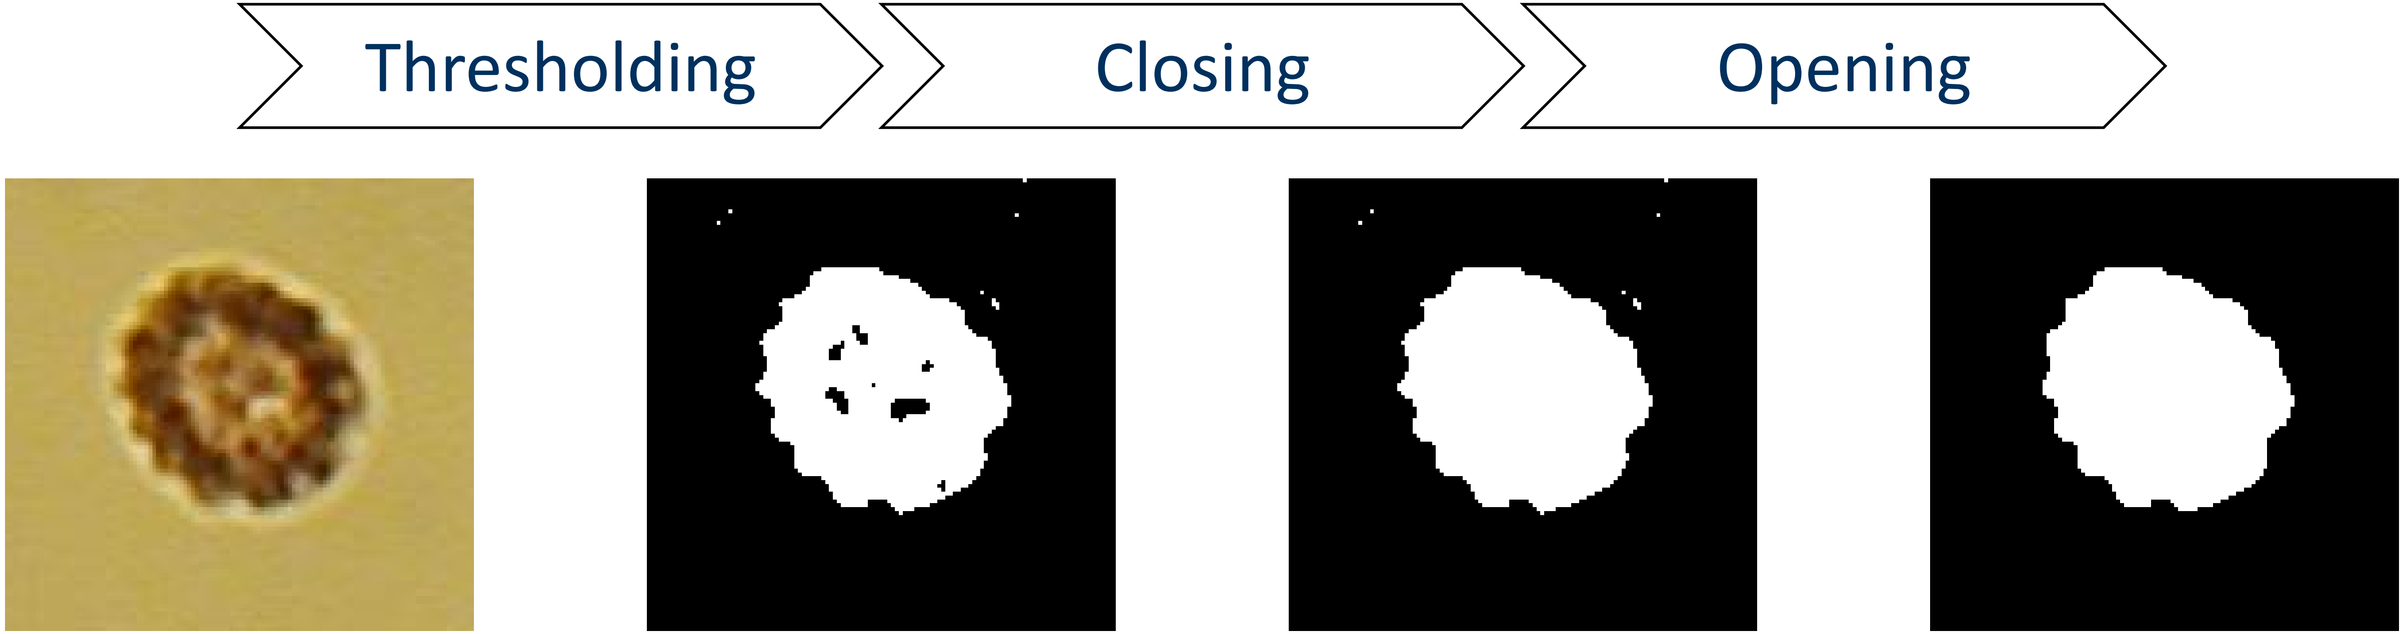
With material from

Robert Haase,

Marcelo Leomil Zoccoler, Physic of Life, TU Dresden

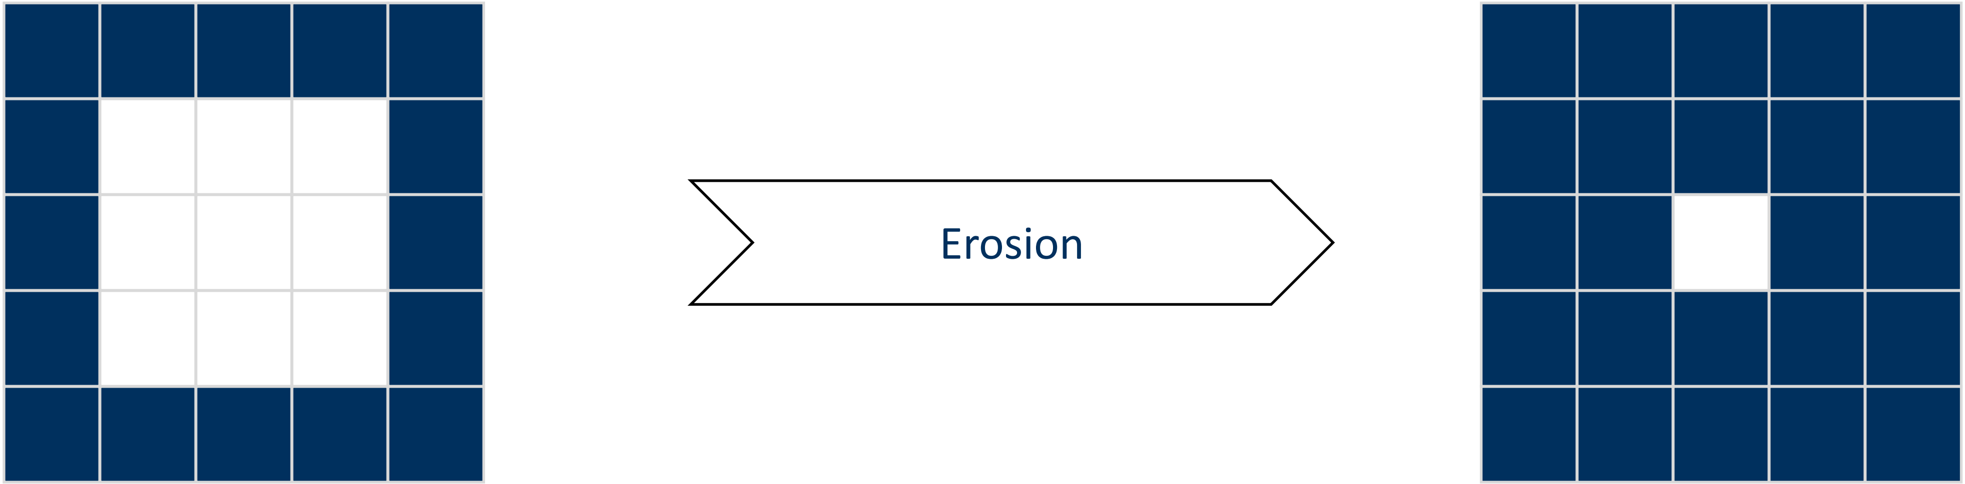
Refining masks

- Binary mask images may not be perfect immediately after thresholding.
- There are ways of refining them



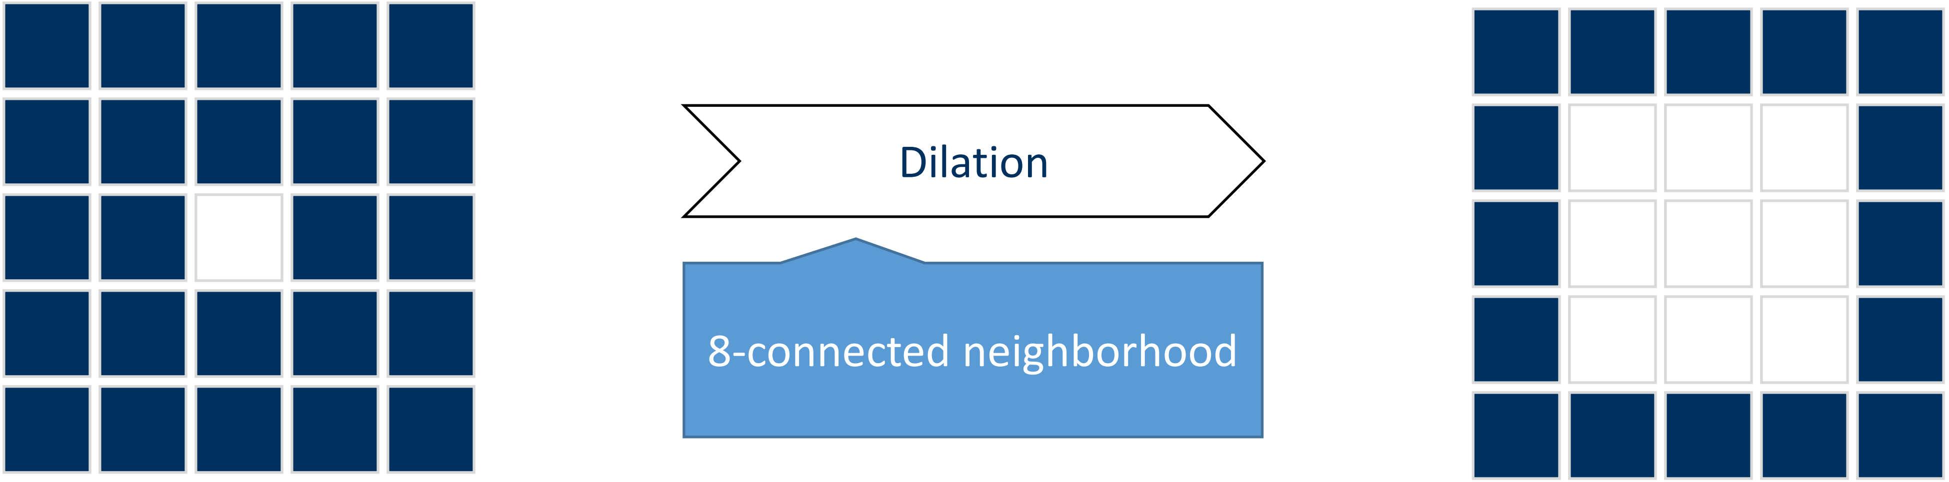
Erosion

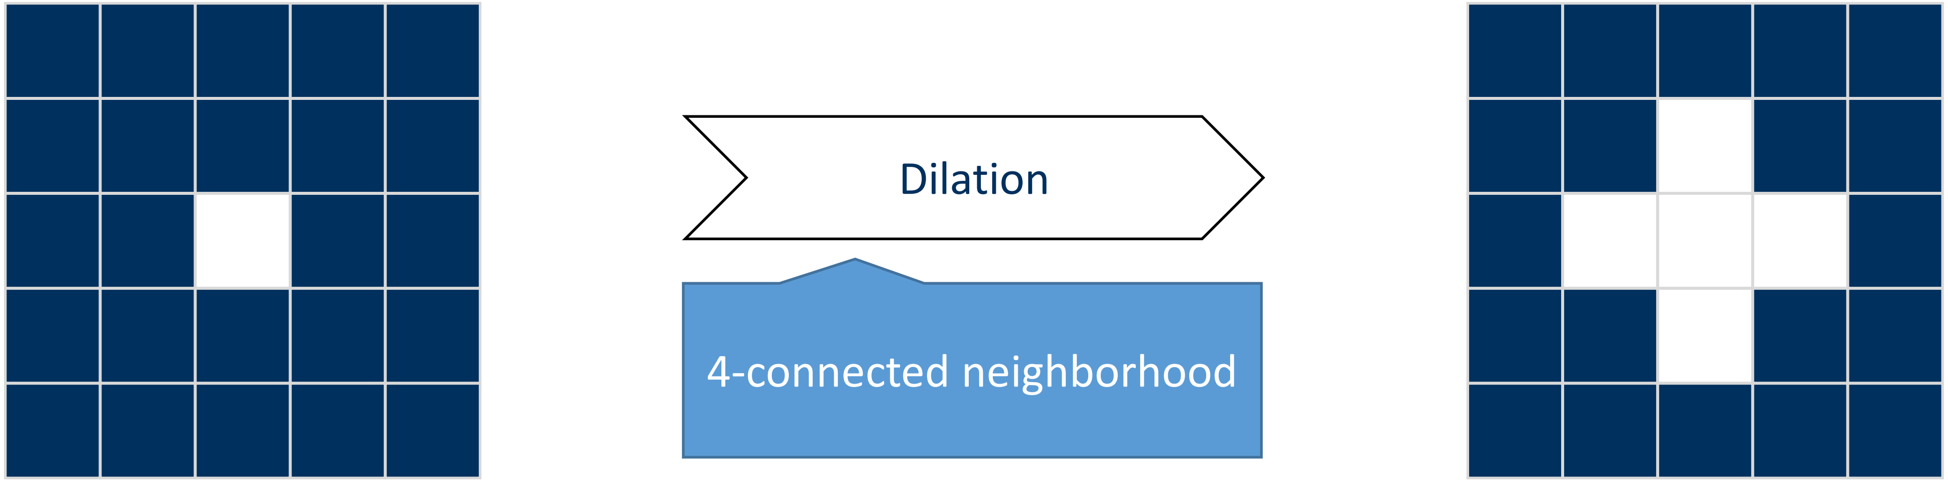
- Erosion: Every pixel with at least one black neighbor becomes black.



Dilation

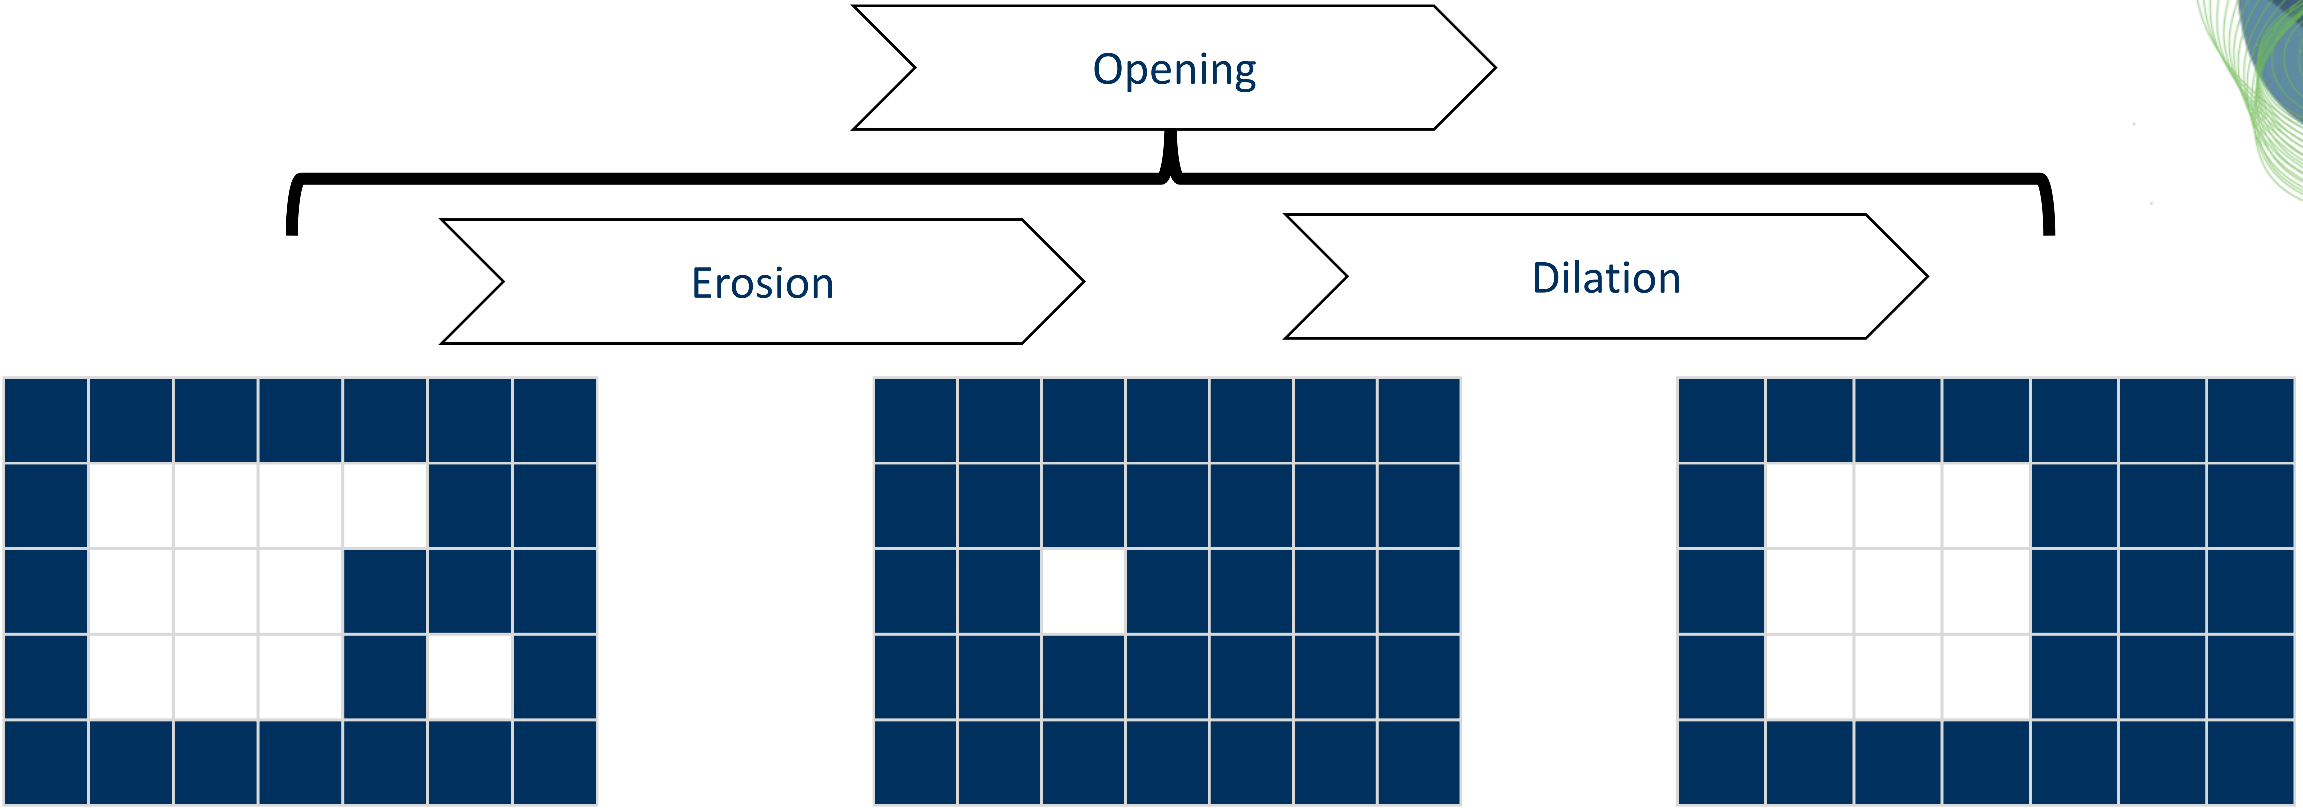
- Dilation: Every pixel with at least one white neighbor becomes white.





Opening

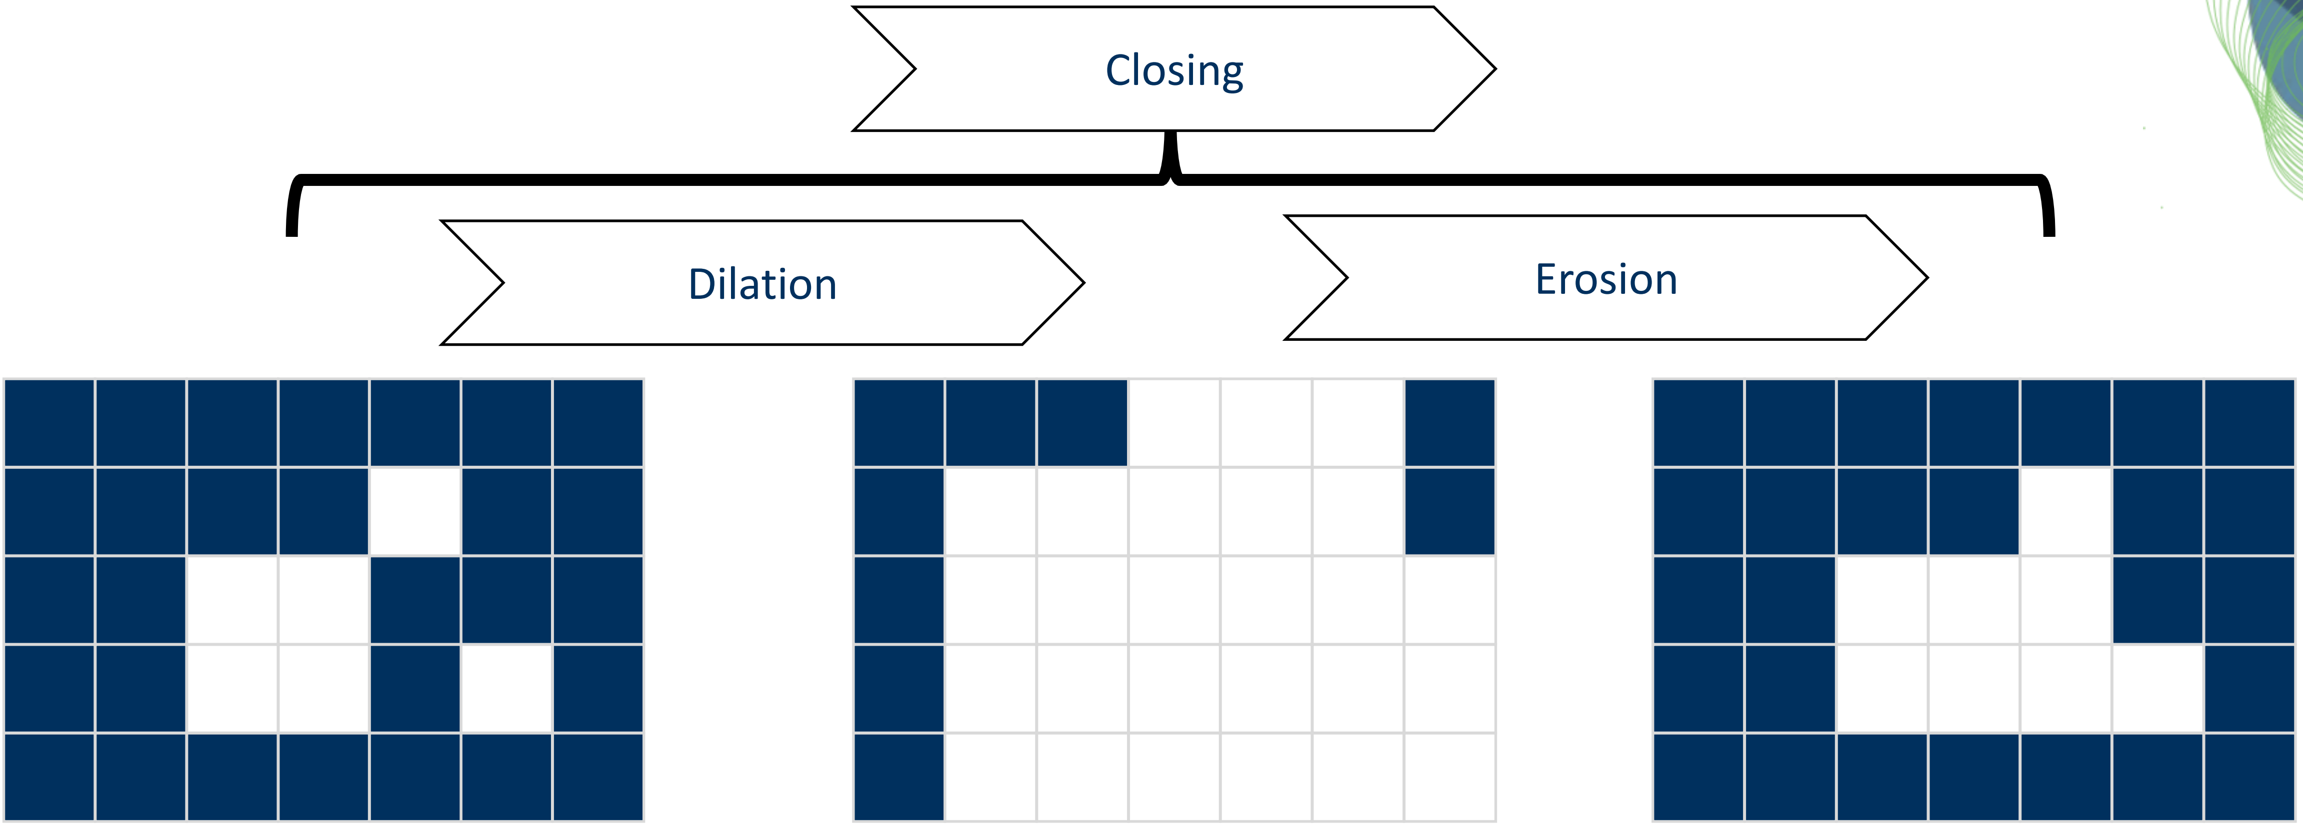
- Erosion and dilation combined allow correcting outlines.



- It can separate white (high intensity) structures that are weakly connected
- It may erase small white structures

Closing

- Erosion and dilation combined allow correcting outlines.



- It can connect white (high intensity) structures that are nearby
- It may close small holes inside structures

Image Processing in Python

With material from

Robert Haase,

Marcelo Leomil Zoccoler, Physics of Life, TU Dresden

Working with images in python

- Open images

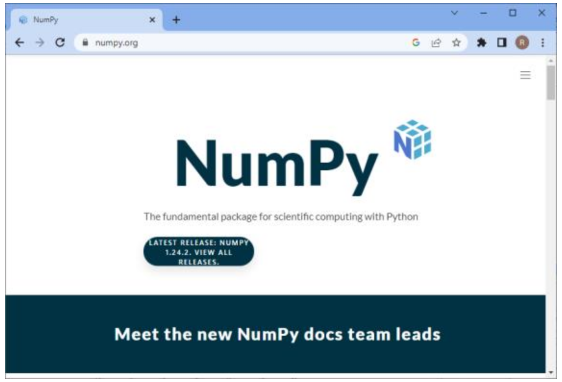
```python
from skimage.io import imread

image = imread("blobs.tif")
```

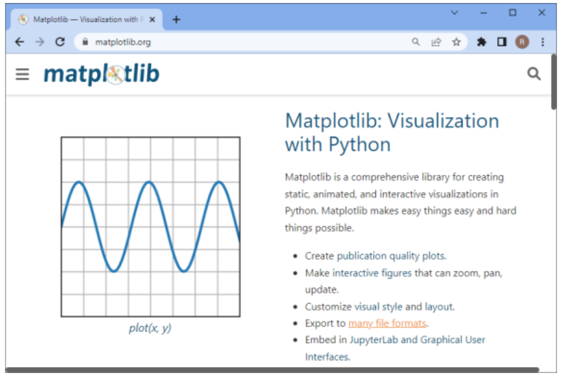
```python
image
```

```
array([[ 40,  32,  24, ..., 216, 200, 200],
       [ 56,  40,  24, ..., 232, 216, 216],
       [ 64,  48,  24, ..., 240, 232, 232],
       ...,
       [ 72,  80,  80, ...,  48,  48,  48],
       [ 80,  80,  80, ...,  48,  48,  48],
       [ 96,  88,  80, ...,  48,  48,  48]], dtype=uint8)
```

Images are *just* multi-dimensional arrays or "arrays of arrays".



https://numpy.org/



https://matplotlib.org/

Working with images in python

Open images

```python
from skimage.io import imread

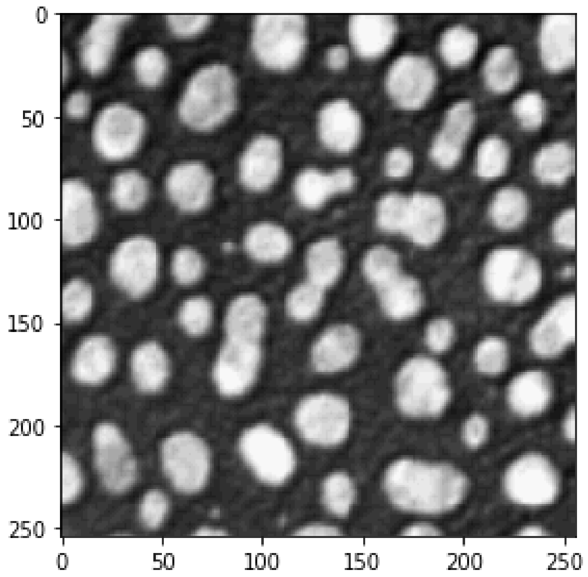
image = imread("blobs.tif")
```

Visualize images

```python
from skimage.io import imshow

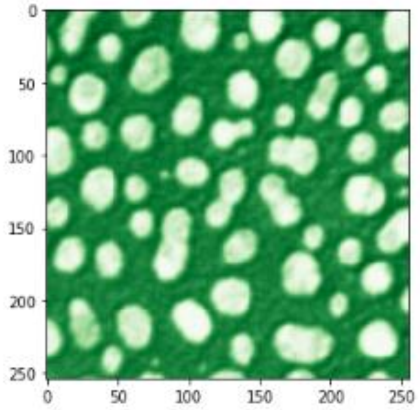
imshow(image)
```

```
<matplotlib.image.AxesImage at 0x245e7
```



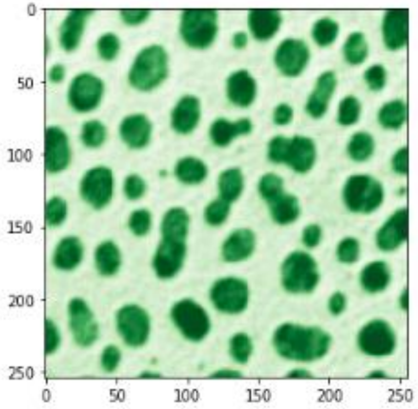
```python
imshow(image, cmap="Greens_r")
```

```
<matplotlib.image.AxesImage at 0:
```



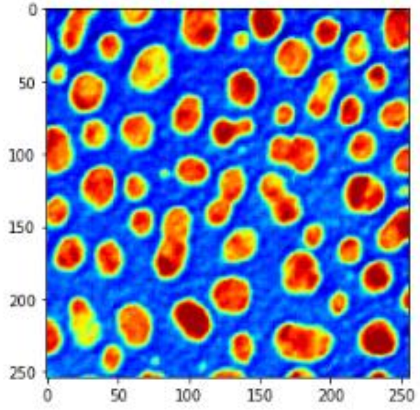
```python
imshow(image, cmap="Greens")
```

```
<matplotlib.image.AxesImage at (
```



```python
imshow(image, cmap="jet")
```

```
<matplotlib.image.AxesImage at
```



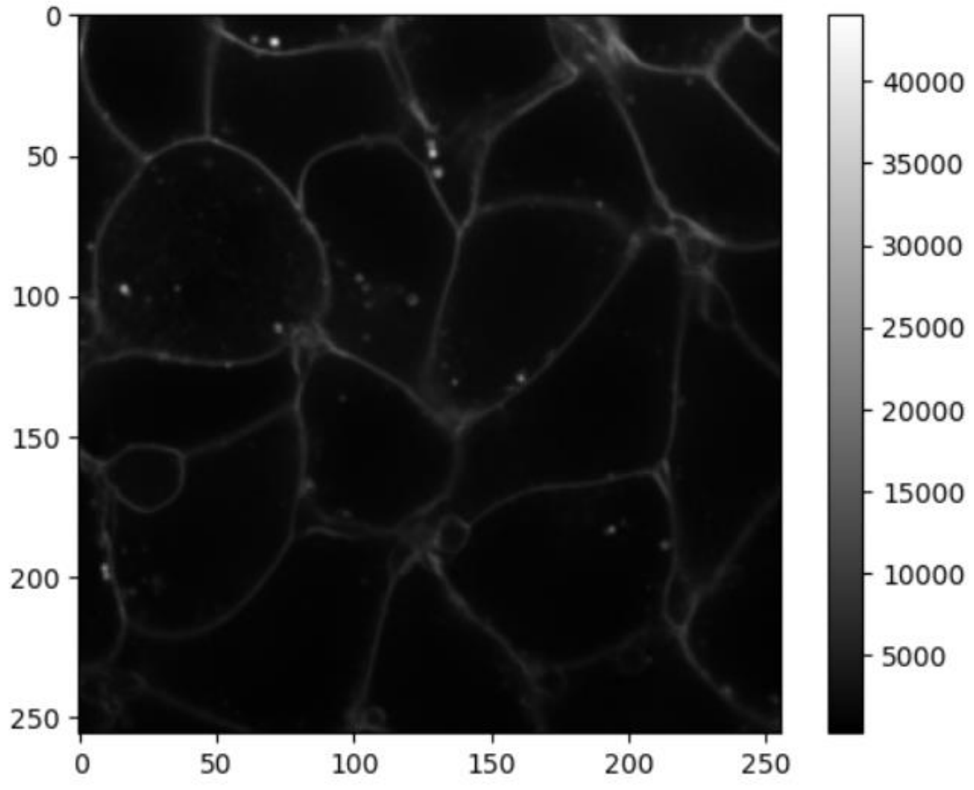
This does not modify the image data. The images are just shown with different colors representing the same values.

Brightness, contrast, display-range

- After loading data, make sure you can see the structure you're interested in

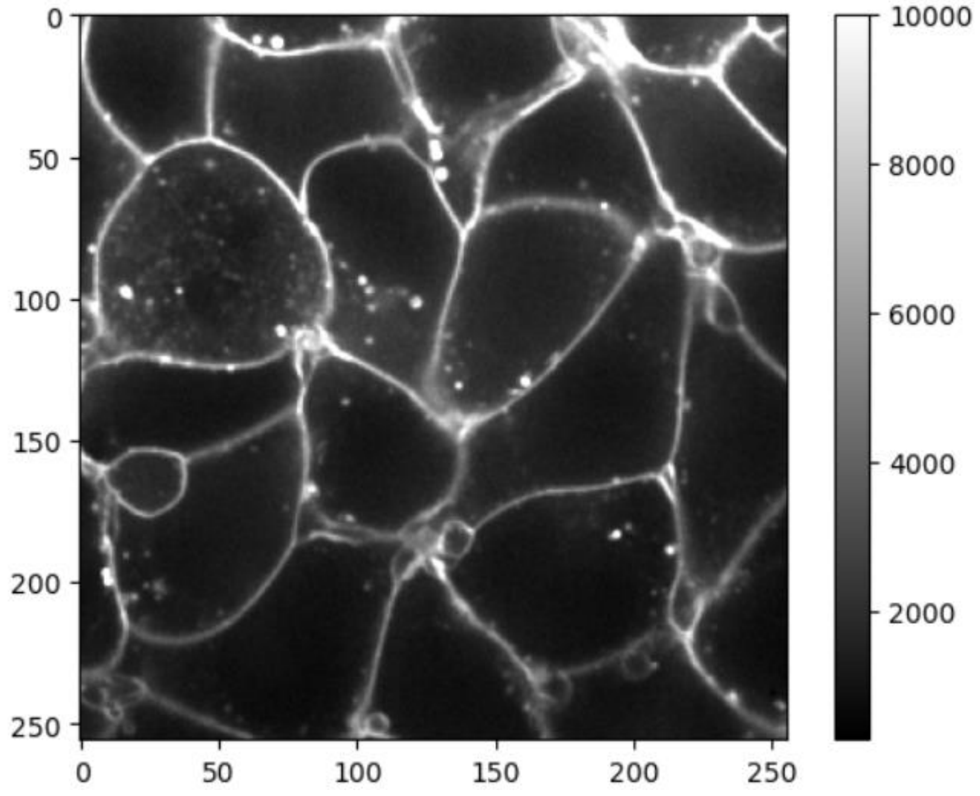
```
plt.imshow(image, cmap='gray')
plt.colorbar()
```

<matplotlib.colorbar.Colorbar at 0x14f22cf71f0>



```
plt.imshow(image, cmap='gray', vmax=10000)
plt.colorbar()
```

<matplotlib.colorbar.Colorbar at 0x14f22d70310>

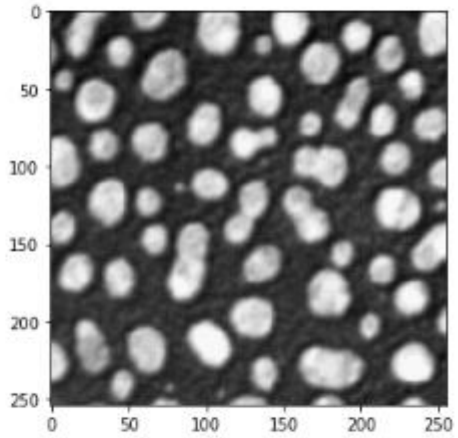


Cropping and resampling images

- Indexing and cropping *numpy-arrays* works like with python arrays.

```
imshow(image)
```

```
<matplotlib.image.AxesImage at 6
```

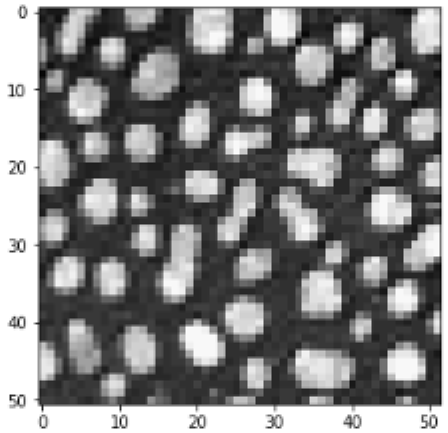


Original image

```
sampled_image = image[::5, ::5]

imshow(sampled_image)
```

```
<matplotlib.image.AxesImage at 0x
```

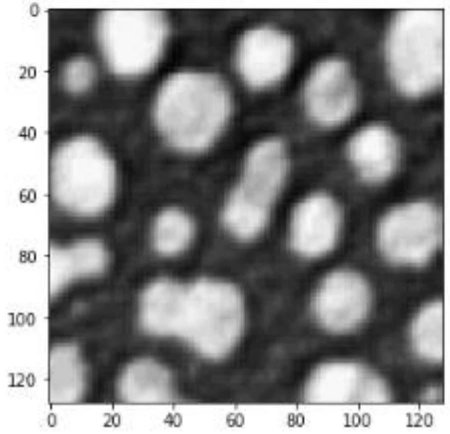


Sub-sampled image

```
cropped_image2 = image[0:128, 128:]

imshow(cropped_image2)
```

```
<matplotlib.image.AxesImage at 0x29e
```

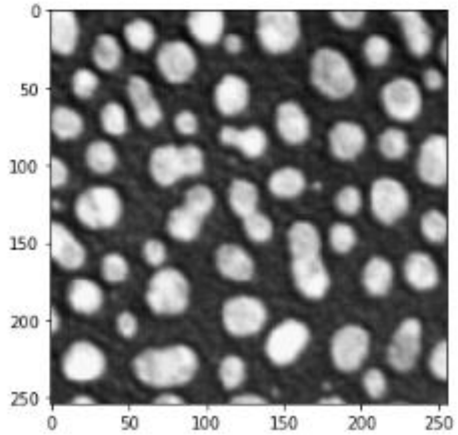


Cropped image

```
flipped_image = image[::, ::-1]

imshow(flipped_image)
```

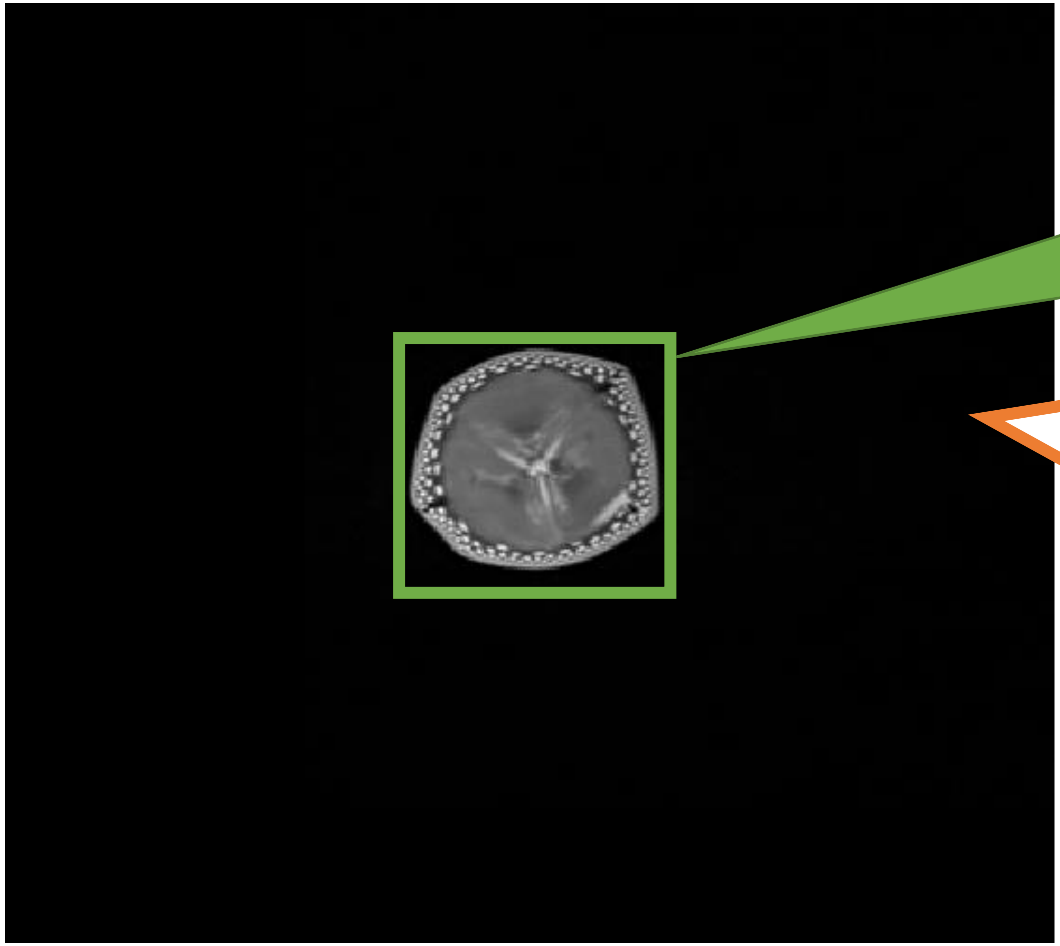
```
<matplotlib.image.AxesImage at 0x
```



Flipped image

Cropping and resampling images

- Crop out the region you're interested in



Interesting

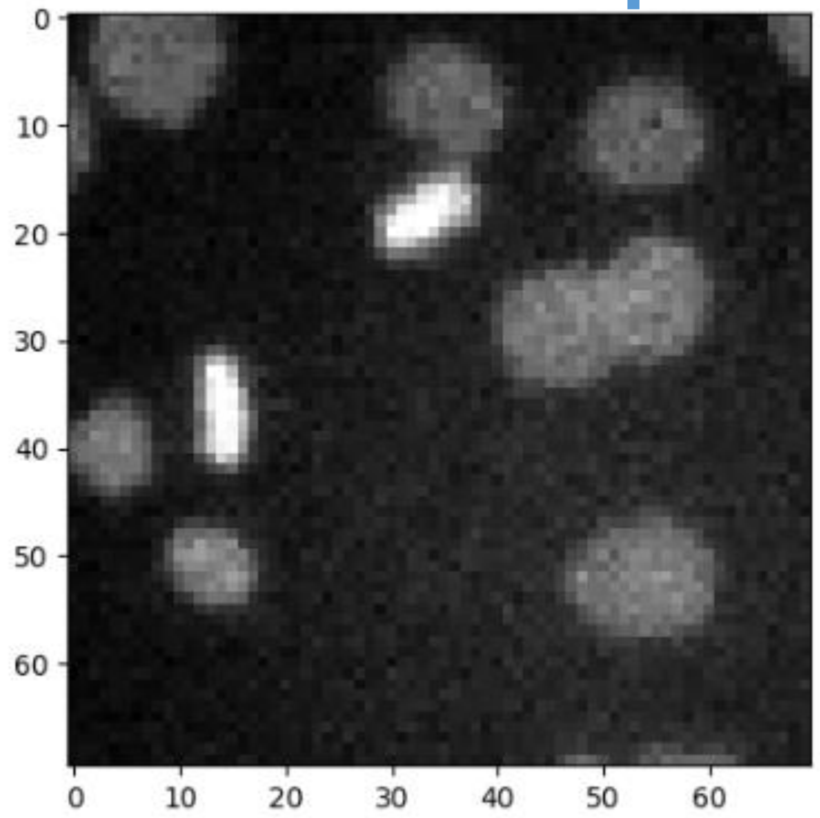
Not interesting

In this case you can spare 8/9 compute time for following processing steps

Image data source: Nasreddin Abolmaali, TU Dresden

Filters

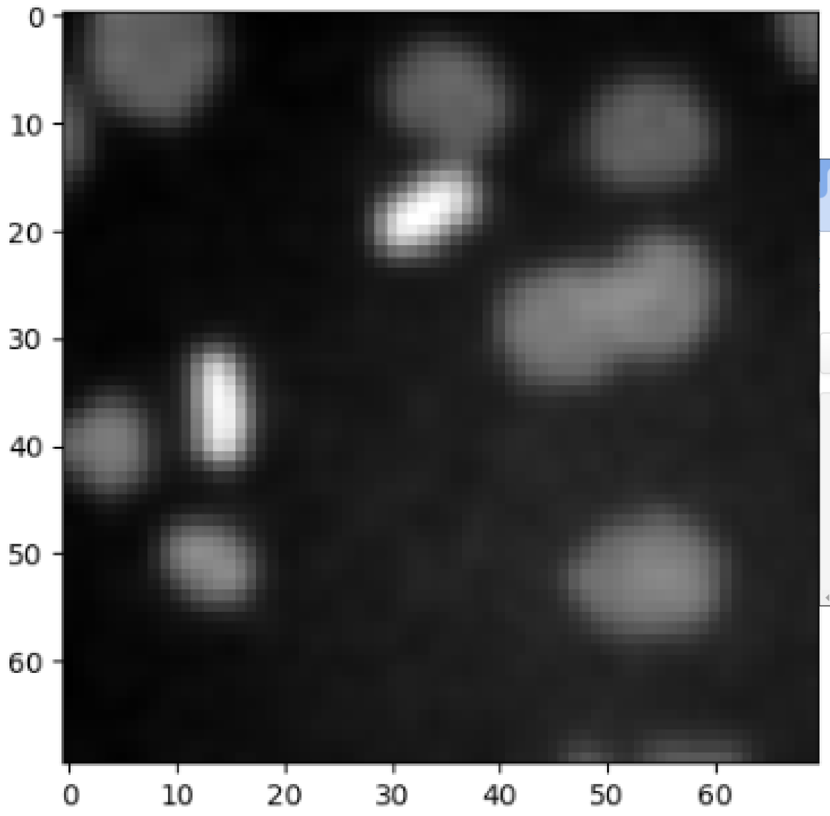
... are just functions

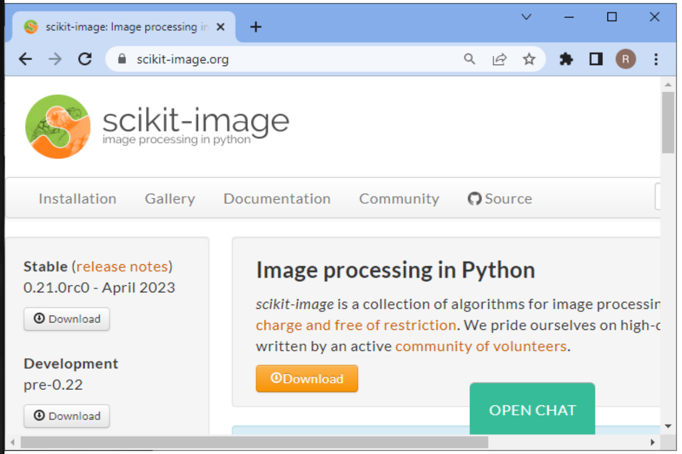


```python
denoised_gaussian = filters.gaussian(image3, sigma=1)

plt.imshow(denoised_gaussian, cmap='gray')
```

```
<matplotlib.image.AxesImage at 0x283aab3ba90>
```





https://scikit-image.org/

Binarization / Thresholding

- Turn images into binary images (very basic form of segmentation)
- When using scikit-image, `threshold_` functions typically return a threshold you need to apply yourself.

```python
from skimage.filters import threshold_otsu
```

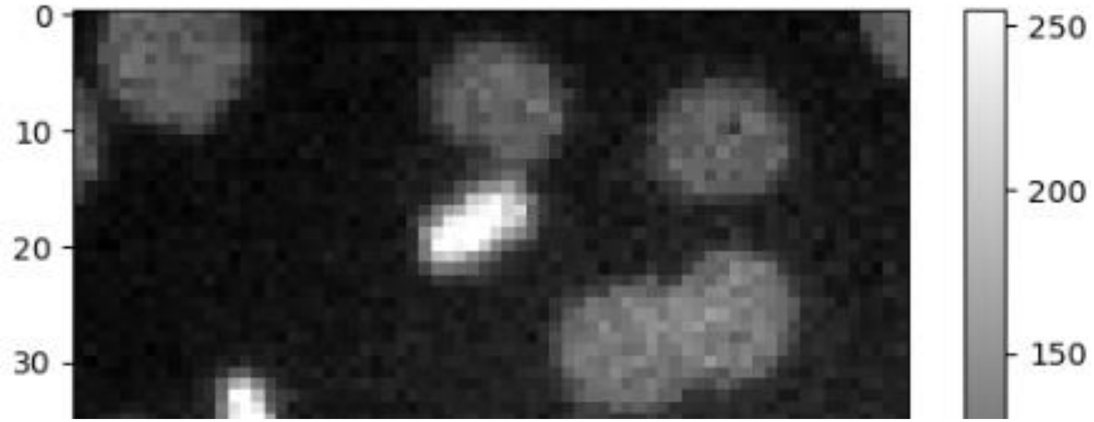
```python
threshold = threshold_otsu(image_nuclei)
threshold
```

```
77
```

```python
image_otsu_binary = image_nuclei > threshold

plt.imshow(image_otsu_binary, cmap='gray')
plt.colorbar()
```

```
<matplotlib.colorbar.Colorbar at 0x1c285b4f550>
```



Morphological operations

- To *morph* objects in binary images

```python
from skimage import morphology
```

```python
eroded = morphology.binary_erosion(image_binary, disk)
plt.imshow(eroded, cmap='gray')
```

```
<matplotlib.image.AxesImage at 0x15288661520>
```

```python
eroded_dilated = morphology.binary_dilation(eroded, disk)
plt.imshow(eroded_dilated, cmap='gray')
```

```
<matplotlib.image.AxesImage at 0x1528893ffd0>
```
